PRESS THE RESET BUTTON WITH TOOTHPICK (HOLE UNDER PTT SWITCH).
11. CHECK THAT YOU HAVE THE NEW FREQUENCIES THEN REASSEMBLE THE RADIO.

YOU CAN NOW PROGRAM
130.00 MHz TO 169.995 MHz
340.00 MHZ TO 379.995 MHz
420.00 MHz TO 469.995 MHz
870.00 MHz TO 899.995 MHz

WARNING !!!!!!! TRANSMITTING OUT OF THE HAM BANDS IS ILLEGAL !!!!!!!

SINCE YOU HAVE THE SOLDERING IRON HOT YOU CAN BUILD A NICE ACCESSORY.
REMOTE MICROPHONE AND SPEAKER.

TO MAKE A CABLE YOU HAVE TO BUY:
1/8" STEREO PLUG "RS #274-284"
1/8" TO 3/32" STEREO ADAPTER "RS # 274-373"
10 K OHM 1/4 WATT RESISTOR "RS # 271-1335"
10 MICROFARAD 35 VOLT CAP "RS # 272-1013"
MATE PLUG FOR YOUR SPARE MICROPHONE.

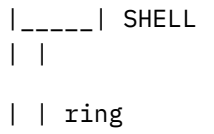
PLASTIC MINI BOX.

I MADE ONE WITH A 8 PIN STANDARD MIC PLUG SO I CAN USE MY SPARE HAND
MIC IN THE CAR WITH A 6" SPEAKER.

SPEAKER MIC CONNECTIONS:

SHELL GROUND
TIP REC AUDIO
RING PTT & AUDIO IN.

CONNECT SHIELD, PTT COMMON AND SPEAKER COMMON TO THE SHELL. CONNECT
SPEAKER PLUS TO THE TIP. CONNECT A 10K OHM RESISTOR AND 10 MICROFARAD
CAP TO THE RING. CONNECT THE PTT SWITCH BETWEEN THE SHELL AND THE 10K
RESISTOR. CONNECT THE MIC PLUS TO THE 10 MICROFARAD CAP. NOW YOU CAN
USE A REAL SPEAKER AND REAL MICROPHONE. THAT WILL ALSO WORK FOR PACKET
BUT USE A .1 MICROFARAD CAP NOT 10 MF....



WELL THATS ALL FOLKS..... 73'S FROM BRYAN (N2KZH)

Note: I haven't tried or verified this, proceed at your own risk. WA2ISE

I am a "Younge Pharte", but ...

back in those good old days, it was common to listen to wider and wider
chunks of spectrum for replies to your CQ, until you in fact were
listening to the entire novice band. After listening to the entire
novice band, and not hearing any replies, you would call CQ again.

To all my net-elmers, Thanks! I passed my novice exams!

I dropped in to a local code class to introduce myself and spend some time studying with like minded people rather than staring at a computer speaker.

At the end of class, some folks were taking their exam and the rest of us were invited to take it for training. When all was said and done, I had passed with the highest sequential number of characters (183) of anyone taking the test!

The novice written went much the same way, although I missed 8 questions. 9 would have failed me. Since I hadn't studied, I was surprised and pleased.

I'm sure I did as well as I did only because of the invaluable information your folks are constantly posting. Thank you again!!

I'll take the technician written in two weeks.. and then off shopping while I wait for the Feds... I'd like to ask for advise on HTs for emergency service when I get a better handle on what that requires.

Regards,

-Rick-

Until after World War II, when precision military surplus components made variable frequency oscillators economical, the majority of operation by amateurs of all classes was crystal controlled. It was the universally acepted practice during non-net operations to tune around for answers to your CQs. Often, to make it easier, the calling station indicated where he was tuning ("here to 3600", "plus or minus 10". etc. All abbreviated. of course.).

Incidentally, the term precision components is no misnomer. The old "Command Set" radios out of B17 bombers actually had jeweled bearings in the VFO capacitors.

>it varies enough. The 440 does SPLIT using 2 vfos. Its not possible
>to work SPLIT [with freqs more that 1.2 khz apart] just using RIT with
>the 440.)
>

The RIT control on the 735 is plus or minus 800 hz with no display
indication. The 735 allows split operation between VFO A and VFO B.
Since the VFOs also store mode options, you can work crossmode as
well as crossband. A second press of the SPLIT switch puts you in
reverse split.

>The 735's controls for mic gain/VOX control were under the little front
>panel door which I found difficult to get too;
>
>However, the 440 has the vox controls on the rear, which is not good,
>it is o.k. because I don't use VOX that much;

I removed the little plastic door on the 735 the first day. It serves no
purpose and can drop open when running mobile in the Jeep.

>I wanted 10 hz freq readout which you get on the 440 after snipping a diode;
>
>I think ICOM has this but was told that the yaesu doesn't;

The 735 does not have the 10 hz digit available on the display. The mode
indicators occupy that position...pity.

>When changing modes on the yaesu you have to cycle through
>usb->lsb->cw->am->fm->back to usb....which means if you want to go from
>cw to usb you have to go through fm which generates alot of noise in the
>speaker;

The 735 has individual switches for each mode. That's nice, I hate the
Yaesu system too.

>The tuning feel of the yaesu and the ICOM is better than the kenwood; sometimes
>I think the kenwood does not have enough revolutions per kilohertz; what I
>mean is that for a very small change in the dial you get a change of about
>200 to 300 khz. I know of no way to change this. On the Icom and yaesu
>when you turn the dial slowly it only changes about 50 to 100 khz.

Yeah this is a major plus of the 735. The tuning rate varies with the speed
that you turn the knob. Also you can adjust the drag on the knob to suit
your taste. I set it tight for mobile and loosen it up for base use. Very nice.

>With the 440 you can get a 1.8 khz wide SSB filter which I find essential
>for working 20 meters. I don't think this is available on yaesu or
>the ICOM 735/725/726.

Optional filters are available for the 735. I have the 1.8 khz SSB filter
and the 500 hz CW filter in mine.

>The kenwood has AFSK ports which I use for RTTY, AMTOR, and PACKET.
>I think that you have to use the microphone jack on the ICOM; the
>yaesu may have an AFSK port, I am not sure.

The 735 has a connector called ACC1 which has PTT, audio in, audio out,
squelch status (goes low when squelch opens), 13.8 volt power, ground,
and ALC in. The manual recomends connecting AFSK equipment here, though
you can use the mike and speaker jacks if you wish.

Also on the rear panel are the beloved transverter jacks and the external
receive antenna jack.

>Of course the 440 is about US$ 100 more than the ICOM or yaesu. The
>auto antenna tuner is another $200.

Icom offers the AT150 autotuner as a standalone box and the superior AH1 which places the tuner at the antenna where it belongs. The coax line is always flat. This thing is expensive, but it is done right. Me, I use a cheap MFJ901 for portable and a Dentron MT3000A for base because I like twiddling knobs. My Drake twins had real TUNE and LOAD controls built in....pity they disapeared on the new rigs.

>I had a small problem with my 440: It made a very faint clicking noise
>when turning the main tuning knob. It turned out that the optical
>encoder had a small mechanical problem with it. Kenwood is sending me
>a new optical encoder at no charge, but in the meantime I was able to

No problems, yet, with the 735.

>There is a new radio from ten-tec called the Delta-II. It is a 100 watt
>(maybe 150 or 200 watts, I don't recall) HF transceiver with 100khz to

>one.

The Delta-II is supposed to sell for around $1300. The 735 has passband tuning and is as quiet as a TEN-TEC Corsair.

3.58 Mhz is not in ANY ham band, thank goodness, or there would be incredible
TVI problems. The standard procedure in rockbound days was to send looong
CQs and looong answers with the entire novice band being tuned for replies
after each CQ. Needless to say, split operation was the order of the day,
tying up two frequencies for one QSO. Tuner-uppers were a constant problem
and often you would turn over and find that another QSO had started on the
transmit frequency of your contact.

> matter.)

Narrow band modes are not necessarily the best way to work weak signals.
witness the ability to copy spread spectrum signals below the noise
floor. Closing this spectrum to weak signal techniques other than CW,
SSB, and AM(!) would be a mistake we could live to regret in the future.
Restricting ineffient modes such as conventional FM and AM from this spectrum,
might be acceptable.

>I am aware of the comments filed by the American Radio Relay League and

>of, or doesn't care about the many who use code regularly on the VHF and
^^^^
a few hundred active mainly during contests.

>UHF bands. Being associated with AMSAT, including being a member of its
>Board, he must be aware of the important role code plays in operation
>via the amateur satellites. Indeed, the way many get started on the
>satellites is through code. It provides a way to construct a simple,
>inexpensive station, capable of satellite operation. SSB or data
>communication on the satellites, usually entails the use of expensive
>commercial equipment. In fact; it is interesting to note that Mr.

To put the expense argument in perspective, only about $200 separates
a CW satellite station from an SSB satellite station. The transverters
don't care, only the amplifier needs to be linear. You need a good
SSB quality receive setup in any case.

>Karn, despite his close and valuable association with AMSAT, makes only
>passing reference to satellites. Other VHF/UHF applications of code,
>the existence of which Mr. Karn ignores, include long haul tropo and
>moonbounce communication. My long years of experience on the bands
>above 30 MHz have taught me that code is particularly valuable. Many of
>the countries I have worked on 6 meters (101 at current count), I could
>have only worked using code. If anything, the use of code is even more

>necessary on the UHF and microwave bands than on the lower VHF bands.
>On at least one occasion, I have been frustrated in not being able to
>work a low power station on 1296 MHz about 120 miles away, because his
>station was not set up for CW operation. I am convinced that codefree

We're all certainly sorry that W3XO was "frustrated", but a codefree licensee could equally claim to be "frustrated" because W3XO doesn't employ DSP techniques. If you want to play the DX game then you must be prepared to meet the DX on his own terms.

Forcing ALL amateurs to know code so that YOU can work them using code is an incredibly selfish attitude.

>licensees will certainly be at a disadvantage on any bands they occupy,
>unless they are satisfied to limit their activities to relatively short
>haul voice and data modes, generally based on the use of FM.

If this were true, which it isn't, then THEIR limitation is THEIR choice and shouldn't concern you. Fortunately, techniques for weak signal work which have been repeatedly demonstrated to be superior to make and break keying in the space and military sectors are becoming available to the average amateur at reasonable costs.

>Another, who does not appear to understand what really goes on on the
>bands above 50MHz is Brian Kantor. He begins his argument for granting
>codefree licensee use of all bands above 30 MHz with the premise "Since
>Morse code is rarely used in VHF and UHF communications..." Surely,
>basing a position on such an erroneous argument should be grounds for
>ignoring the remainder of his comments. Nevertheless, I will deal with

I would consider a few hundred contest DXers using CW a few weekends a year as being fairly called "rare" when considered as a percentage of total usage on the VHF bands.

>the past. Mr. Karn, Mr. Kantor and many others, who seem to think that
>VHF/UHF operation is limited to FM and packet (also FM), ignore the
>impact of turning lose an additional hoard of FMers on 2 and 6 meters
>without some kind of protection for weak signal narrowband modes. Mr
>Kantor compounds his lack of knowledge by the following statement:
>"Even the traditional advantage of Morse for weak signal communication
>no longer holds true: digital signal processing techniques have yielded
>communication systems which can be built by the ham experimenter that
>will provide reliable communications at received signal strengths far
>below those at which the human ear can even discern that there is a
>Morse signal present." THIS STATEMENT IS ABSOLUTELY FALSE. Some day,
>it may be true. Many VHF operators hope so. There have been many
>promises over the years for such a utopian scheme that would make
>moonbounce available to the "average" VHFer (100 Watts and a 12 to 15 dB
>gain antenna). But, so far, no one has demonstrated such a system.

Your statement is FALSE. Check with N4HY et al about working moonbounce with Oscar class stations and DSP.

>The answer is that more goes on inside the human brain in digging out
>weak signals than most people realized. Maybe, some day, the process
>can be implemented on a few chips, and maybe even improved upon; but it
>hasn't be shown to work that well yet. I won't waste my time and that
>of the Commission discussing further Mr. Kantor's comments. I am happy
>to see that he stopped short of proposing that the Commission "ban"
>Morse code, although he seems to have considered the idea.

So JPL has hundreds of dedicated CW ops straining at their cans copying data from Voyager eh? Get real! Techniques for copying extremely weak signals have been in use for at least two decades. These techniques and newer techniques are now filtering down to the amateur budget.

CW, like restoring antique radios, is a pleasant passtime for some, but claiming that it is ABSOLUTELY UNBEATABLE as a weak signal mode is totally false. Claiming that CW is a cheap way to communicate says that you consider the months of time spent unproductively learning the code had no value. If on the other hand you consider your time to have value, then CW is a very expensive way to communicate. Slow too.

On the one hand we hear CW proponents saying that it will "get through when nothing else will" and on the other hand they scream for protected sub bands so they won't get wiped out by other modes. Seems kind of like a contradiction to me.

I am leaving for the UK in two weeks and would like to locate a PC
based shareware/public domain station logger and/or contest logger
for my laptop. Something like the K1EA (v4.25 or >) would be nice.
Please forward information or uuencoded file to
Katz@sask.usask.ca

Source record: 8505

Looking for any modifications of the TS-430S, especially

* receiving freq from 100Khz and up,
* better scanning options (e.g. stopping on a station while scanning in FM mode)
* impoving FM selectivity.

TKS, and 73 - Adi, 4Z4VG

I beg your pardon??? Last I heard, 80 meters was from 3.5 - 4.0 Mhz.
Gee, I hope they didn't move it when I wasn't looking. :-)

1196. STS-35 SAREX Update and JSC BBS

Newsgroup: rec.ham-radio
Date: 1990-09-15 19:57:37 UTC
From: garym@sugar.hackercorp.com
Message-ID: <6570@sugar.hackercorp.com>
Source record: 8507
Cross-posted to: rec.ham-radio,sci.space.shuttle

Subject: STS-35 SAREX Update and BBS Info

The launch of STS-35 has now been re-scheduled for Tuesday morning,
Sept 18 at 05:28 UTC. The following elements may be used for pre-launch
orbit predictions.

STS-35
1 00035U 90261.27986111 .00031000 00000-0 22174-3 0 0030
2 00035 28.4690 270.3379 0005720 246.6067 119.6564 15.71792660 23

Satellite: STS-35
Epoch time: 90261.27986111
Element set: JSC-003
Inclination: 28.4690 deg Space Shuttle Flight STS-35
RA of node: 270.3379 deg Pre-launch flight profile
Eccentricity: .0005720 Keplerian Elements
Arg of perigee: 246.6067 deg Launch: 18 SEP 90 05:28 UTC
Mean anomaly: 119.6564 deg
Mean motion: 15.71792660 rev/day W5RRR
Decay rate: 3.10E-04 rev/day^2 NASA Johnson Space Center
Epoch rev: 2

The Public Affairs Office at the Johnson Space Center operates a BBS to
provide information to the public. Check this board for updates to the
keplerian element sets during the flight. A message will be posted
indicatiwhat file contains the new element set. The current element set
for the Sep 18, 1990 Launch is found in the file STS35.003 in directory 99.

To access the BBS, call 713-483-2500 using 1200 baud, 8-N-1, at the
ENTER NUMBER: prompt, enter "62511" and you will be connected to the BBS.

NASA JSC's Electronic Space Information BBS is intended to provide 24-hour
access to biographies of NASA officials and astronauts, news releases,
space flight mission presskits and television schedules, space shuttle
systems information, flight manifests and schedules, and other infor-
mation about the space program.

SAREX Timeline (WA4SIR)
Updated 9/4/90 0740 CDT

Times are given in Mission Elapsed Time (MET) which does not change relative to the launch time. You will need to add the MET to the launch time to determine the time these events will occur.

During the times the ROBOT is on packet operations will take place, crew tended periods will normally be voice operations. Primary downlink frequency is 145.550 and primary uplink is on 144.950, secondary uplinks are 144.91 and 144.97. See AMSAT bulletins for more information, in particular ANS-237.01 (8/25/90), ANS-230.01 (8/18/90) or contact W5RRR during the flight on 28.400, 21.350, 14.280, 7.227 or 3.850 for more information.

SB RTTYDX @ ALLBBS $RTDX0914
RTTY DX Notes 1of3 9/14/90

RTTY DX Notes for week ending 14th September 1990
BID: $RTDX0914
Part 1 of 3.

This is the last request for logs of the ANARTS RTTY DX Contest held
in June this year. You may be first in your country, even though you
have a small score, or you might help to prove that someone else won
it. So send your logs to W. Storer, 55 Prince Charles Rd, Frenchs
Forest, Sydney 2086 NSW Australia.

These notes are getting shorter each week, because the propagation is
getting poorer despite what the propagation reports are saying. Also
some of our reporters have been distracted by other attractions, like
holidays. We still hope for better things next week.

Our thanks this week go to I5FLN, I5ICY, I5IGQ, JA1BLV, OD5NG, TG9VT,
W2JGR, W6/G0AZT and the Tri-State DX packet cluster network. Thank
you all for your information and interest. Please keep it coming.

RTTY DX Notes 3of3 9/14/90

RTTY DX Notes for week ending 14th September 1990
BID: $RTDX0916
Part 3 of 3.

QSL Information:

9J2BO says to QSL via W6ORD.

UJ8JCQ QSL address is Box 1102, 734032 Dushanbe, Tadzhikistan, USSR.

8P9HR will QSL via K4BAI.

S79NBD is JG1NBD when he is at home, so send the cards to his home address.

Notes of Interest:

It seems that I made a slight mistake last week with the QSL management of 1S0XV. It appears that JA3DPB and W4FRU are the managers for the rest of the world, while Russians may send their cards to Box 308, Moscow 103009. So now you have three QSL managers. I think that I have it right this time.

JG1NBD is operating from the Seychelles S79 until 16th September. JH1NQG should be signing KC6CW while JH1BNL should sign KC6DX from 13th September until 16th, after which they will move to Yap from 16th until 19th, where they will sign V63AN and V63AR respectively. QSL to their home calls.

7J1ADJ should also be making a noise from Minami Torishima from now until the 21st. QSL to KB1BE.

JH1QDB will be on Ogasawara (JD1) from 23rd until 30th September.

F2JD will sign CE0ZZZ from Juan Fernandes from mid November, and will be running RTTY with gear supplied by IRDXA.

GL DE DX1 (VK2SG).

Written by VK2SG. Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA.
Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU.

> I have a question: If novices were required to use crystals to generate the
> xmit freq, and assuming that you don't have a really big selection of
> frequencys (i.e. crystals), then how would you go about answering a CQ? If
> you are not on the same freq, then how would you expect the other guy to hear
> you? Keep answering, and wait for the other guy to eventually tune his radio
> and stumble on your answer? Seems that would take a long time before you
> connect. Or was there an agreed on contact frequency, that everyone would buy
> crystals for? Then you tell each other what freqs you have xtals for, and
> move there? Is 3.579545Mhz in the novice band? (I don't have the allocations
> memorized or handy). That freq would be a very common crystal, as it is the
> color TV color info subcarrier. If it is, then that might be a contact freq.
>
> 73 de WA2ISE

Yup, what you did was to transmit on your crystal frequency, the
other guy would transmit on his crystal frequency, and you'd both
have to tune around to find who was answering. This normally
limited your contacts to +- 10 khz within your transmitter freq.

It was kind of funny. After transmitting rock bound for several
months, you got to know the other guys who had similar crystals
REAL well. They were the ones you spent most of your time
talking to!

I forget what the exact freq bands were... but I spent a lot of
time with a 7.??? crystal.

Being rockbound made you really appreciate the General class guys
who'd come down and zero beat your transmit frequency so you could
talk to them. It gave you someone new to talk to!

1200. Software postings in this group.

Newsgroup: rec.ham-radio
Date: 1990-09-15 22:44:34 UTC
From: jgd@rsiatl.UUCP
Message-ID: <4015@rsiatl.UUCP>
Source record: 8511

I've watched this discussion regarding fixing the "problem" of software being posted to this group with rising amusement. Many people have suggested a number of solutions but no one has yet hit on the most obvious of all - let the people who have a problem with software in this group fix the problem for themselves.

If someone running a mail gateway, say Brian for instance, thinks that his downstream sites would be so offended by or so driven to poverty by the transmission costs of software or other files in this group, then let that person fix the problem. It is trivially easy to screen traffic on the basic of a) size and/or b) content (the leading "M" in uuencoded files is a dead givaway) and/or format (fixed length lines, for example). Using Deliver, that would be a 15 minute task. Then the rest of us who value such postings could continue to benefit from them. Of course, it IS much easier just to bitch about it....

That said, I too would support a group of the form rec.ham-radio.software. Dispense with all the nonsense about a separate group for each computer. Most hams use PCs and for the non-PC software, a simple keyword in the title line will differentiate it from the PC stuff. This group would be an ideal place for Phil's latest TCP/IP stuff as well as all the other ham oriented software. Perhaps Bdale could even be pursuaded to set up an automatic poster daemon for the IP stuff. I say this, of course, because he stated a couple of years ago that it would take too much of his time for him to do so when I asked him to set up an automatic E-mail posting to me so I could redistribute to non- Internet sites.

So here's my suggestion. In the interim, continue posting to rec.ham-radio. And in that interim, let's find someone to volunteer to hold a formal discussion and vote for a software newsgroup for ham radio. Any volunteers?

John

> >recognized experts in the field.
> >
>
> Language chauvinist! :-)

:-)

> If a program gives results in a reasonable amount of time, and the algorithm
> is properly implemented, who cares what language was used.

The reasons are this:

BASIC is a toy language for toy computers. Don't get me wrong, toys are fun things to have; I have toys; you have toys; he who has the most toys.....:-)

PASCAL was originally intended to be a teaching language, not an implementation language. As a language it is poor for serious development. However groups like Borland (Turbo Pascal) have done a remarkable job of converting a poor language into something useful and powerful. Unfortunately they have done so for only one platform (PC clones, MS-DOS).

C is a systems programming language and fits at a point somewhere between assembly language and other high level languages. It is not the most ideal language to do scientific programming, but it is universally available and there are good compilers for free (GNU GCC for UNIX) or for low cost (Turbo C by Borland and Microsoft C) for PC clones. Rumor has it there is a good C for Macintosh, but I'd not be in a position to verify that.

Fortran is THE scientific programming language, and antenna modeling is just such an application. My tendency in such things as antenna modeling is to be as detailed and discrete as possible in the model. I'm talking simulations that take a few hours to run on an IBM 3081 or Convex C240 mainframe; several thousand segments. This is not a practical option on a PC with BASIC. Not all Fortran compilers are up to snuff, unfortunately.

If all I was going to do was run a small model, never hack the code, and never try to validate the algorithm, a BASIC program for a PC would be fine. But in reality, I will often need to modify the program or verify its algorithm, or even revise it to new technology. Source is required in a language that is easy and practical to maintain. Because I do serious systems programming and development across multiple platforms over a range of computers, the languages I will be proficient in will be assembly (for various machines), Fortran, and of course C. Basic, Pascal, Cobol, Lisp, etc., are not among them.

> If I were an antenna manufacturer, I wouldn't depend on a computer simulation
> to design my antennas. Real range data is much more valuable.

I can twist your words here because I think you made a slight word slip. The design phase definitely needs antenna modeling. The engineer can examine many different ideas quickly this way. But constructiong real antennas and testing them in real life situations is a MUST. Each is a sanity check on the other.

[more kindling on the fire]

How about comp.sources.misc for things in source code, and comp,binaries.?
for whatever machine type the binary is for.

The big advantage is that these already exist and are usable now. As far
as I know, there is not restriction of the type of programs posted there,
and I have seen some variety at times.

> connect.

I was first licensed as WN7CSK in 1965. In those days, because of crystals,
no one on the Novice band calling CQ expected the answer to come back on
their frequency. CQs tended to be longer, answering was longer, and the
calling station would always "tune the band" looking for a response.

I ran a Heath DX20 into a wire on 80 meters, and the receiver was a
Knight Kit Star Roamer, 4 tube general coverage receiver with NO BFO.
I had one crystal for 3743 KHz (most Novices I found later bought crystals
toward the middle of the band) and I used a knife switch for antenna
changeover from receive to transmit.

No, 3.579545 MHz is not, and was not ever, in the Novice band. The Novice
band was from 3.7 to 3.75 MHz. I am not sure, but I think there was
a change in this allocation. I think the whole segment shifted down 25 KHz,
so it is now 3.675 to 3.725 MHz. I believe this was done in the last year.

That is what it USED to be, when I was a Novice. I think it changed this
year. Here is my evidence:

SB ARRL @ ALLUSA $ARLB010
#10 80m. Reallocation 3/2/90
QST DE W1AW
ARRL Bulletin 10 ARLB010
From ARRL Headquarters
Newington CT March 2, 1990
To All Radio Amateurs

On March 1, The FCC announced that it proposes to change authorized
frequencies for Novice and Technician Class operators in the 80 meter
band. Current authorized frequencies would be changed from 3700 to 3750
KHz to 3675 to 3725 KHz. FCC believes that such relocation would reduce
interference in the 80 meter Novice segment and is asking for comments
from the amateur community.

Copied from W1AW by Tad, KT7H @ N7HFZ.WA.USA.NA.

>responsible for the current 14.313 mess, but I'm not sure of that.

Nope. You are way off there. ARF is "Amateur Radio Forum" Which is the net run by NR9Q, Thursdays at 10PM EST. I note you support the 2nd ammendment. The net is VERY PRO Gun Ownership, among other topics. It is a current Events discussion net. (Thurs, 10pmEST, 3950khz)

I might like to add that people should decide for themselves if Schmidling is Anti Semitic or not. For one thing, Schmidling himself is Jewish. He is, IMHO NOT anti semitic. He opposes US AID to ISRAEL, which by the way OTHER Americans of Jewish Decent also do. As I understand it, he feels that Jewish Occupation of the West Bank is much akin to the Iran takeover of Kuwait. Actually on the surface, the two events have a certain ring of similarity.

Please do NOT continue this debate HERE in rec.ham.radio. If you MUST post a defamatory message about Schmidling or anyone else, take it to a more apropriate newsgroup. I am posting this reply ONLY to correct the error that ARF and BARF are related. I can ASSURE YOU there is ABSOLUTELY NO CONNECTION between the two groups. I also take offense at your characterization of NR9Q, and encourage those interested to judge for themselves by reading his postings OR better yet checking into his net this coming thursday. It could surprise you.

Please NO MORE OF THIS DISCUSSION IN THIS GROUP!

It has finally happened. SOMEONE finally got fined for the 20 meter mess. Not the chicken squawker, Not one of the ten thousand tape players on the frequency, or the people that swear like longshoremen. Those people DON'T ID.

The fines went to key members of the Better Amateur Radio Federation (BARF).

Herb Schoenbaum, KV4FZ.... Dick Eastman, N5FX, and one other lesser player all got $1,000 fines for "causing interference" to other stations. Actually, they received "Notice of Apparent Liability", which is NOT EXACTLY a fine.

The fines do not seem to have quieted Schoenbaum, who is as verbal as ever. Eastman, a blind ham living on social security, is a bit more subdued of late. FZ was in Florida this past week. Rumor has it he is going to try and fight the fine, since HE claims he was fined for ANSWERING a call on frequency at the time he allegedly was supposed to be causing the interference.

It would seem that the FCC has targeted the BARF BOYS. Certainly if they were somehow no longer on the air, a great deal of this controvercy would vanish quickly. These operators are like the bellows in a foundry, keeping the flames high by pumping in a lot of wind.

However, one has to admit that much of what the BARF boys say happens to be dead square on the money. Perhaps it is just the WAY they say it, and the fact that they say it and say it and say it and say it that causes the problem.

I don't think it is over yet.

Stay tuned to either 14.313 or 14.300 depending on who got where first when.

>So here's my suggestion. In the interim, continue posting to rec.ham-radio.
>And in that interim, let's find someone to volunteer to hold a formal
>discussion and vote for a software newsgroup for ham radio. Any
>volunteers?

Let's not.
Instead, let's use the groups that already exist for such things: the comp.* groups. For example, the recent Super Morse posting should have gone to comp.binaries.ibm.pc, for two reasons: 1) it's where binaries for the IBM PC belong, and if your site doesn't get c.b.i.p, then you shouldn't try to end-run binaries around the restriction; and 2) it may well have gotten wider exposure that way, thus giving people who don't read rec.ham-radio a chance to play with a Morse Code program, thus possibly breaking down one of the excuses for not getting into ham radio. (Oops. Not politically correct. Ignore that last.)

A proposal for rec.radio.software will be met with exactly this objection from the admins of the net. For such a group to pass, it will need an answer to that objection.

Nothing mysterious about it. You used 1/4 inch mesh wire screen. It was sort of like HEAVY duty chicken wire fencing, only maybe 14 guage wire (and square holes). You could cut it to shape, fold it, bend it, solder leads going to ground to it, run wires going elsewhere through it. Neat! If you needed a tube socket hole, you snipped a few wires and poof! a hole. It was strong enough to mount almost all kinds of hardware on - even small transformers. When you got the thing working right, you rebuilt it permanently using conventional materials. (Then, of course, it no longer worked!)

Anyone know if Genie Information Systems (the nation-wide computer dial-up system similar to compuserve) has any support areas for amatuer radio?

Also is there any E-mail gateway access to any of the E-mail systems. I am told that Compuserve does have some sort of gateway.

This inquiry was prompted by Genie's decision to offer flat-rate connect time starting 10-1-90. Similar to Prodigy, but only $4.95 monthly non-prime without the trashy graphics, trash software, and slllllllooooooooowwwwww response. This flat-rate doesn't apply to all of Genie's offerings, but to many including their E-mail system.

Would appreciate any responses (even the ever-present flaming barbs) especially from any current subscribers of Genie who will soon have to make the decision to join the flat-rate crowd or drop the service.

SAREX OPERATION PROCEDURE 1

HR AMSAT NEWS SERVICE BULLETIN 258.03 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 15, 1990
TO ALL RADIO AMATEURS BT

Understanding the Basics Will Make SAREX a Success (Part 1)

The Shuttle Amateur Radio EXperiment, also known as SAREX, has sparked interest in space communication in a large number of amateur stations around the world.

For a good number of stations, this may be their first attempt at talking to other than "earth-bound" stations. By understanding the basics of when it is possible to communicate with Ron Parise, WA4SIR, it will make it a more successful experience for all involved.

First it must be understood that the orbiter Columbia is in low earth orbit. It will be at an altitude of about 150 miles traveling at about 17,500 mph. Being in low earth orbit it will move across the sky very quickly and is not like a geostationary satellite which appears to be fixed at one location in the sky at all times. This means that at best, you will have no more than about 10 minutes maximum during which Columbia will be visible from your QTH during any particular orbit.

Because all communications with SAREX will be done in the 2 Meter band, once Columbia "drops" below the horizon, it will not be possible to communicate with Ron or the packet ROBOT on-board the Orbiter (propagation at 145 MHz does not bend with the ionosphere like it does on HF). Attempting to call Ron when Columbia is not visible from your QTH is pointless and can in fact be disruptive to other amateur communications. Your transmitting frequency of 144.95 MHz is also used in some areas by amateur packet systems. To minimize the disruption to other stations, it is necessary to derive a schedule of when Columbia will be above the horizon and to verify that transmissions from Columbia are in progress on 145.55 before attempting to transmit. Part II of this bulletin will provide some examples of this schedule, and give you information on how to derive one for your QTH.

/EX

Just in case you missed it (perhaps you have been on vacation for the past 4 months) here are the SAREX frequencies:

Shuttle Shuttle
TX Freq RX Freq
+-+-+-

There should be about 3 KHz of Doppler shift due to the orbital velocity of the Columbia spacecraft (it will be about 3 KHz high near the beginning of a pass and about 3 KHz low near the end). By limiting the deviation of your transmitter to 3 KHz, Ron's receiver should have little trouble capturing your signal.

TRACKING SOFTWARE PIRATED

HR AMSAT NEWS SERVICE BULLETIN 258.06 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 15, 1990
TO ALL RADIO AMATEURS BT

Pirated Versions of AMSAT Software are Appearing on BBSs

A number of BBS sysops have called into AMSAT Headquarters inquiring as to whether Instant Track was now being offered as shareware or is in the public domain. It seems that there are people who are uploading the software into BBSs from which anyone who dials in can download a "free" copy. In many cases the copyright information is still intact when running the program.

NONE of the tracking software which AMSAT offers is in fact shareware or in the public domain. The distribution of software is one of the major contributors to the funding of the construction, launch and operation of AMSAT's satellites.

These pirated versions of the software represent a serious threat to future spacecraft development. If any of you see any software which is being distributed by BBSs that does not look like freeware, please inform the SYSOP immediately. With many thousands of files on most BBS systems, it is not unusual for SYSOPS not to look at all of them.

DRIG WX SATELLITE UPDATE

HR AMSAT NEWS SERVICE BULLETIN 258.07 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 15, 1990
TO ALL RADIO AMATEURS BT

DRIG Provides WX Satellite Frequency Summary

Jeff Wallach (N5ITU), Chairman of the Dallas Remote Imaging Group (DRIG) wants to remind OSCAR satellite users they can easily process weather satellite Automatic Picture Transmissions (APT) using a large part of their current station. If you have a 2m beam or a turnstile with a pre-amp, if you have satellite tracking software and a general coverage receiver which can tune to a 137 MHz, you are not far from being able to process WX pictures. Ideally the 137 MHz receiver you use should be capable of wideband FM modulation with a 50 KHz wide IF, but N5ITU had experimented with FM scanners which have 150 KHz IF with good success! Jeff points out that there are several interface cards which can easily be installed into IBM PC computers and clones which will turn the APT signals into very detailed pictures (4 km of resolution). Once you have the weather image signal and its audio is routed to the interface card in the back of your PC, with the proper

software, the pictures are easily produced on a EGA or VGA screen. For further information about what it takes to process APT pictures, please read Bulletin #17 on the AMSAT/DRIG BBS at (214) 394-7438.

Weather Satellite Frequency Summary

WX SAT	CAT #	Frequency	Status
NOAA 09	15427	137.620	Active-Afternoon

OPERATIONS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 258.08 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 15, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule Announced

AMSAT Operations Nets are planned for the following times. Mode B nets are conducted on an AO-13 downlink frequency of 145.950. Mode J/L nets are conducted on an AO-13 downlink frequency of 435.970.

Date	Phs	mode	UTC	NCS	Backup	U.S. day
28 Sep 90	171	J/L	0100	KA5SMA	N5BF	Thursday
9 Oct 90	172	J/L	0015	WD0E	WB9ANQ	Monday

An AO-13 re-orientation is scheduled for 15 October 90. The new Operations Net schedule will be distributed starting next week.

For information on the amateur satellite program and how you can participate, contact AMSAT-NA at P.O. Box 27, Washington, DC 20044, phone (301) 589-6062, or contact your local AMSAT Area Coordinator.

SB ALL @ AMSAT $ANS-258.09
AO-13 / AO-10 TRNSPNDR SKED

HR AMSAT NEWS SERVICE BULLETIN 258.09 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 15, 1990
TO ALL RADIO AMATEURS BT

A new Transponder Schedule for AO-13 was put into effect on September 8
which is planned to continue through October 17.

Mode S operation has been eliminated for the time being since relatively poor
solar panel illumination does not allow sufficient power for proper battery
maintenance during Mode S and S/B periods. Satellite reorientation (a.k.a.
magnetorquing) is scheduled to commence on October 15 and once it has been
completed, it is expected that Mode S will be returned to service.

The present transponder schedule for AO-13 is as follows:

Mode-B : MA 003 to MA 165
Mode-JL : MA 165 to MA 195
Mode-B : MA 195 to MA 240
Off : MA 240 to MA 003 (Mode B Beacon On)
Omni Antennas : MA 240 to MA 060

The September 10 attitude estimate is:

BLON = 205 and BLAT = -7

AMSAT-OSCAR-10 appears NOT TO have been receiving sufficient solar panel
illumination to support Mode-B transponder operations. Both beacon and
transponder signals started showing signs of FMing. Therefore, until further
notice please DO NOT use AO-10's transponder.
It is expected that AO-10 may once again receive sufficient solar
illumination to support Mode-B transponder operation by sometime in November.

mikey@pnet01.cts.com (Mike Shirley) writes:
>Anyone know if Genie Information Systems (the nation-wide computer dial-up
>system similar to compuserve) has any support areas for amatuer radio?

Yes -- a full Radio/TV RoundTable. Pretty reasonable, too.

>Would appreciate any responses (even the ever-present flaming barbs)
>especially from any current subscribers of Genie who will soon have to make
>the decision to join the flat-rate crowd or drop the service.

Me? I'm slowly disconnecting from USENET and connecting with GEnie. Costs me
a bit more, but definitely worth it. Turns out that (1) having to pay a
little money, and (2) having sysops that slap idiots hands once in a while
cuts way down on the noise, stupidity and flaming that USENET is famous for.

I agree!

This makes a mess of the INFO-HAMS digest, too.

> A proposal for rec.radio.software will be met with exactly this objection
> from the admins of the net. For such a group to pass, it will need an answer
> to that objection.

I believe this will very likely be the case. Post things in the appropriate
comp.* group and if people there complain that things should be in a ham
related group (not likely due to the low numbers) then that is usable as
the answer to the admin objections.

RE : Common sense

Come on - give me ONE good reason for posting, not once but twice, the unreadable reams of SuperMorse source code.

Posting source code is a ridiculous waste of net resources and is just plain annoying. If you have source code, why not just post a short message saying that you have it and giving your e-mail address? Wouldn't that be a better idea?

The novice band is currently 3700-3750. I found myself spending a lot of time in this band when I held my tech license, and made my first-ever HF contact with N8JLK, running 3rd party before I had received my license in the mail.

I would be interested in a history of how the bands have changed over the years; like a time-line showing what bands expanded, moved, were taken away, etc. over the years. Does anybody have such a thing prepared for posting?

I see what you're saying - it sounds like a discussion group, where not only software would be posted, but also discussion about commercial packages, etc. I had to look at what you said three times to understand the meaning.

The problem is that it's not just for binaries.

>Cheating? How else would you do it with ONE WIRE? RF? Nawwwww...

I haven't tried this but it should work: Use capacitors or transformers to couple audio oscillators or mechanical buzzers to a pair of wires, or a single wire and ground. The receiver is earphones (high-Z or appropriately coupled). Full QSK, no switching required.

I have a photo of a Japanese VLF CW transceiver captured on Guam Island in WW2. It was used for communicating between caves and tunnels, and for directing artillery. The transmitter is a high-frequency buzzer, the receiver uses a coherer (!). The antenna was a very long wire which perhaps extended outside the tunnels. I don't know if it was grounded at the far end, as in earth-dipole communications.

The Japanese are traditionally famous for doing the unexpected in war. This rig not only communicated through the ground, but used frequencies unlikely to be monitored or jammed by the enemy.

Reference on Japanese radios of the war: _Popular Communications_, December 1988 p. 20.

Does anyone know of any references or previous tests done on common commercially available VHF antennas? In particular, antennas like Ringo Rangers, Huster G6/G7's, Station Masters, Telex/Hy-Gain VxS series, etc.? In particular, things like radiation patterns/radiation angle, gain, bandwidth, etc. The manufacturers give most of these figures in their handouts, but they probably aren't all that accurate from what I've seen.

Also, somewhere there is a book that talks about the design and "how to make your own" version of many of the popular antennas, including the Station Masters. Anyone know the name and/or publisher of this book?

This letter was forwarded to me by a friend to got this from another newsgroup (rec.humor ??) of which I have no access. No social ramifications are implied. (I just thought it was a funny letter too...)

Dwaine, N5HD

==========

The following is an actual letter. The original
was typewritten, and all spelling and grammar has been carefully left
intact, including errors. I thought this was pretty funny.

To Mr. (name omitted)
District Manager for Alabama
Radio Shack
3300 N. Pace Blvd
Pensacola, FL. 32505

Dear Sire,
This letter is complain about the problems I have having with the ham radio model number 19-1101 I had got from your company Radio Shack. I had this shipped special to me from your store 1096 Eastdale Mall Montgomery Alabama. I was got this because I think that i would get transmitt furthur that I did with the TRC 217 40 channel walkie talkie.

The problem that had first was when I was going to hook this radio HTX-1000 to the antenna the conektor on the radio was wrong it wouldn't attach to my cable. I was able to hook it finally by making a small change in in the connektor. As soon as I tried to use it there was no sound coming at all. This happened for two days and I never did get to talk to anybody the whole two days. That day the cable company came knocking my door and said there was something causing problems at my house and disconnekted my radio from the cable line. you knew when i brought the Radio that I was going to use that for my antenne. You didn't tell me not to why not?

Next time I decided to put the HTX-1000 in my automobile I thought I would see how it worked their. I hooked it to my CB-antenna and at least I could hear people. But what happens now is no one wants to talk to me because they says you have to have a licencs to talk to them. Why? I dont have to have a licencs to talk on my CB. They'll talk to me there. Anyhow it dont matter much anymore because somebody done took the radio HTX-1000 from my automobile.

What I would like for you Radio Shack to do is refund my money because I don't have the radio anymore and its not my fault i dont and I think you should give me back my money. Also the cable company here says that I hurt something in there line and want to be paid fix it. It will cost

$27482.98 to fix the equipment they say was damaged because you didnt tell me not to hook it to the cable. Please remit to me the check for $27758.53 for damages due. To save this matter from going to court the check must be in my hand by June first or I will turn this over to my attorneys of law.

Thank you

Try Shunt Feeding your Tower!?

Hello DXers!

Some time ago I read some very interesting articles about
shunt feeding towers. After reading through some material
I understood how it works. Shunt feeding a tower is not
at all difficult and seemed to give very good results.

I decided to use two one inch tubes rods in parallel for
the gamma section (to make it broadband) up to the
top of the tower, fed through a series and a parallel
capacitor at ground level. The tower is 60 feet high and
holds a TH6DXX and a 402CD (2el 40-m-Yagi), so the top
capacity provided by those two antennas would certainly have
a positive influence. The gamma section was connected to
the tower just below the lowest antennas, at about 50 feet.
About 3000 feet of radial wire was buried to keep ground
losses low. Finding the right positions for 80 and 160m
took a little longer than I had thought, but I managed it.
I later calculated the impedance of the tower from the
settings and this was well within the theorhetical predictions.
So far so good ...

First thing that happened when I wanted to give it a try
on 80 this night was that one of the 12-V power supplies
went up to around 22 Volts and almost damaged the 70cm radio.
The rotor control jumped around like crazy and everything was
'hot' in the shack. No doubt: RF.

The shack is about 50 feet away from the tower and it is
below the ground level (in the ceiling). The outside of the
coax cables coming down from the tower carries the RF.
How to get rid of the RF on the cable? I buried the cables
under the tower. They now disappear in the ground below the
tower and come out of the wall in the shack. But the RF is
still there ...

I could think of big ferrite cores but where can I get cores
that are big enough for RG-213?

Any other ideas?

There are *lots* of things that can go wrong with a supposedly stable VFO!

> I also had the VFO tank toroid lying down on the ground plane, and my
> books disagreed about whether or not the "self-shielding" capability of
> toroids went quite to such an extreme; the Mark II had the toroid vertical
> and well away from other components.

The self-shielding probably wasn't the problem, but the stray capacitance
between the windings and the groundplane will definitely cause frequency
instability over time and temperature. Either standing the toroid up, or
supporting it well above the groundplane with a *thick*, stable insulator
should help.

> The most likely killer, however, was trusting Active Electronics "NP0"
> capacitors; they list the AVX part numbers that specify NP0 characteristics
> for some of their capacitors, but the circuit got a *lot* better when I
> used ceramic disks with the little black mark on top...

I haven't seen a problem with the monolythic multilayer NPO capacitors, I
wonder what is going on. Another problem area is the temperature coefficient
of the toroid core. Even with carefully selected compensation capacitors,
the circuit will be less stable than the equivalent air-core toroid.

When desiging a VFO for a portable radio, be sure to use a mechanical
dial to indicate frequency. It's just too frustrating to see the
frequency wander back and forth on a digital display ;-)

> To which I might add: Homebrewing is being surprised.

Amen to that. But for me, anyway, it is also more fun than actually
using the stuff, once built. I tend to make a contact or two with my
new piece of gear, then say "Well, it works!", and let it gather dust
from that point on.

I am in the process of getting my
Novice license. I know little about
antennas and would like some advice.

I would like to get an antenna system
that would enable me to use my Novice
frequency privileges to the fullest
extent.

My limitations are that the maximum
length of dipole would be about 70 ft.
Large non-dipoles are out as well as
a lot of different dipoles (multiple).
This is due to my location.

Is there a small non-dipole or a 70 ft.
dipole that could fit the bill?

Thanks,

Jim Allen

> a change in this allocation. I think the whole segment shifted down 25 KHz,
> so it is now 3.675 to 3.725 MHz. I believe this was done in the last year.

Several others have (politely!) pointed out my error as well. For my
traditional whining excuse and attendant rationalization, Let me say this:

Well, I looked in the 1988 ARRL Handbook, and waded through the U.S.
allocations. They didn't have the subbands plainly marked, but I thought
I could decipher the page-and-a-half of "limitations". I guess I couldn't!

Why doesn't the handbook show the bandplans? They don't change *that*
often! (or do they?)

-Paul -wb6cxc, *not* operating in the 80M Novice band (thank goodness!)

1230. Query About Electret Microphone Operation

Newsgroup: rec.ham-radio
Date: 1990-09-17 17:53:00 UTC
From: nix%muppet.decnet@CONSRT.ROK.COM
Message-ID: <9009181958.AA01955@ucsd.edu>
Source record: 8441

I'd like to hear from anyone who has some experience with the working of the `electret' type microphone. I've built an adaptor, to allow me to use the headset from my 2 meter FM hand-held with my Tentec Paragon HF transceiver, and am having some difficulties with high distortion.

The Paragon (since Tentec sells electret microphones) has a low-level (about +8.4 VDC through 680 ohms) voltage available on one of the pins in the microphone connector. In a `universal' (small universe) adaptor box that I've built, I'm providing a portion of that voltage to the headset's connector, with a DC blocking capacitor in the audio output.

A long time ago (but not so far away) I can remember reading some of the early `this is how they work' articles regarding electret microphone elements. `Back then' (as I remember), the early electrets were basic-ally a charged film suspended between two `screens'. A sound wave caused the film to vibrate and, since it was electrostatically charged, the mechanically vibrating film induced an AC voltage across the `screens'.

Rather more recently (the last few months I think) I saw something on electret type microphones, and I believe (can't quite remember enough of the article to be sure) that the inferance was that current electret microphone elements incorporate a pre-amp within the housing of the microphone.

If electrets do now incorporate internal pre-amps, then my problem is most likely that I've just dropped the DC voltage too low, and all that needs to be done, to cure the high distortion, is to reduce (perhaps eliminate) the series voltage dropping resistance, so that the electret's internal amplifier is operating in its linear region.

I was cutting back (using series resistance) on the voltage, to try and set the electret's audio level to be comparable to that of my normal station microphone (so I wouldn't have to fiddle with the microphone gain on the radio). If the electret is a simple `charged-film' type device, then dropping the `polarizing voltage' should work to reduce the audio output. If there's an active amplifier within the microphone itself, then obvously dropping the impressed DC voltage across the element is not the way to reduce the audio output level, and an attenuator (isolated from the DC supply voltage) is called-for.

Typing this now, it seems reasonable that a simple `film-type' electret element would show very high output impedance, and therefore the higher than expected (compared to my regular microphone) audio levels are a strong indication that there is some internal amplification being provided within the electret housing.

Last night (Well OK, it in the wee-hours this morning), after several hours of checking-and-rechecking the wiring in my `universal mic adaptor' box, it was not nearly so obvious what was probably going on.

The interface box serves to provide for 4 different types of microphone connectors, and also as a switch, to allow me to select either a micro-phone, or my PK-232, as the audio input to the radio. So, even though audio interfacing to an HF radio is pretty straightforward, there can get to be a fair number of wires going all over the place. Putting it all into a small diecast aluminum box, and working too many hours, can result in a situation where `obvious' things are not ....

Thoughts & comments would be appreciated.

In article <2523@naucse.cse.nau.edu> rrw@naucse.cse.nau.edu
(Robert Wier) writes:

"I have a question: If novices were required to use crystals to
generate the xmit freq, and assuming that you don't have a really
big selection of frequencys (i.e. crystals), then how would you
go about answering a CQ? "

Back then (as WH6FON), I had quite a few crystals... probably a half dozen
or so :-). Several on 15M, a couple on 40, and one or two 80m ones. 15m
was used primarily as I recall. Remember that other novices had the same
restrictions, so standard operating practice was to tune around your
frequency a fair bit. Also, back then, it didn't take ten turns of the
frequency dial to tune 10 khz (I exagerate to make a point). Also, "most"
operation tended to be in particular areas of the novice subsegment.

In fact, I tended to use only ONE crystal for most contacts, and had no
trouble (for a 12-13 year old) making lotsa contacts. Trivia quiz:
what issues of the Pop'tronix did my picture show up in?

I had dymo-labels on the top-end of my crystals for quick frequency
changes (ft-243 crystals were on the large side, and had plenty room for
labels).

I used a HT-40 transmitter during my novice days (as well as a string
of home-brew transmitters and converted ARC-5 stuff).... sigh... the
junk I used to have.... :-)

Awhile ago I was in a radio store and I was reading through a magazine. I came accross a neat article, but I ended up not buying the magazine and then forgetting about the article. Now I find that this article might be very useful to me. Murphy's law... Anyways if you recognize the article that I am about to describe then please E-mail me. I would like to know the name of the magazine and the issue date. I would also be willing to pay for you to send a photo-copy to me.

The article described how to build a cheap video frame grabber for the Commodore 64 computer. The author was using the video digitizer as a sort of cheap slow scan TV system by transmitting the bit map via packet radio. I thought that the quality was rather poor, but the entire circuit was very simple and inexpensive. The article included a grainy picture of the author in his ham shack. I think info was included for ordering kits and PC boards. The surprising thing was that I have seen audio digitizers that looked more complicated than this video digitzer.

I am pretty sure that the magazine was Ham Radio, but I can't be certain. The issue date was late 1988 or early 1989. The local library does not have this magazine (or any other radio magazines).

If you can help, Thanks.

From: pescatore_jt%ncsd.dnet@GTE.COM
Message-ID: <9009181133.AA04144@bunny.gte.com>
Source record: 8456

I had a free initial introductory offer to Genie and used my free hours up pretty quickly. If you are looking for ham radio and computer related stuff to download, it was a pretty good service. Anything that charges per minute is too expensive for me and I have found that I almost never use the software I do download. Most of the other interesting stuff on Genie cost extra money (stocks, news, etc.) and I am not into interactive CB channel stuff (wierd stuff), so that was all a big waste to me.

I have been using Prodigy for about a year and it is puny weak ham radio-wise. In fact, I wrote up a proposal for an expanded ham radio area and submitted to Prodigy HQ, but it was turned down. They are purposely (is that a word?) not targeting a techno/radio/CPU-nerd market (my words) and are going more for Harry and Hariet and Hillary Jr. Homeowner who have a home computer and got tired of putting recipes on it.

I actually enjoy Prodigy quite a bit, although I spend no more than 10% of my time in the ham radio area. Between work, packet, this stuff, and all my ham operating, enough is enough. I would rather read movie reviews or check stocks than download yet another morse code practice program.

Having not done any quantative work on these systems I wonder:

1) Do they work better with a button on the end of the string
or is knotted string better.
2) How much improvment does the wax make.
3) What is the attenuation per unit distance vs string
thickness/material.
4) Is it necessary to match the cans or does a larger
can make a better transmitter or receiver.
5) How well does an oatmeal box do compared to a coffee can.
6) Are the "synthetic" material cans any good, how about
the composite cans.
7) Are aluminium cans better than steel.
8) What effect does string tension have.

> My guess is that (1) converting to FM would be super expensive for airlines
> and general aviation aircraft owners and (2) the taxpayers won't foot the bill
> for the jillions it would cost to change all the ground stations.
> 73, Dube N5PDK

If memory serves me correctly, the principal advantage in retaining AM for aviation radios is that AM is superior to narrow-band FM for weak-signal detection. At low input signal-to-noise ratios, the output S/N ratio of AM will be superior to the output S/N ratio of FM due to the onset of spikes in the discriminator output (the FM threshold effect). Somewhere in one of my communications texts is a graph of the output S/N ratio vs. input S/N ratio of both AM and NBFM, and it does show the superiority of AM over FM for weak-signal work. Of course, now that I'm *looking* for the thing, I can't find it. The closest thing I can find is a graph in Taub and Schilling (Principles of Communications Systems, published by McGraw-Hill in 1971) which plots the relative output S/N ratios of FM (for several values of modulation index) and coherent detection of SSB or DSB-SC signals (see Fig. 10.1-1, p. 321).

This is probably one of those rare instances in which retention of old tech-nology actually has a technical rationale which coincides with the inertia of a large installed user base.

I remember the HW-16; quite a nice three-bander (80,40, and 15), aimed specifically at the Novice licensee (75W, CW only, crystal-controlled or usable with external VFO). I remember helping a kid down the block put one on the air--he was awaiting his Novice ticket, and he wanted me to give the radio a checkout. Worked a GI3 while he stared, bug-eyed.

A friend with whom I keep a semi-regular sked sent me a photocopy of a Heath ad from CQ, circa 1968. It was a two-page spread; talk about nostalgia! I had actually forgotten how extensive was the line of Heath equipment. For me, whose source of income was mowing lawns, dollars were very hard to come by; what little equipment I could afford usually came from Benton Harbor.

> - Bob Wier
>
From what I have written above, Bob, it is obvious that I do.

I guess I can put in a plug for the Heath SB-1400 transceiver, which is really a Yaesu 747GX with a few cosmetic changes (and the name Yaesu does appear in a few places in the radio itself). The price of the radio and power supply bought separately were rather steep, but the combination price was better than the prices for which I could buy comparable radios and power supplies. I have thoroughly enjoyed this radio and would recommend it to anyone. My only apprehension is that if Heath should withdraw from amateur radio entirely, service may or may not continue to be available. If the latter, I hope that Yaesu would be willing to service the radio should it ever need it. The best-

case scenario would be that Heath would find a buyer actively interested in maintaining a presence in the amateur-radio market in the US.

I had a simular experience. I went to a office supply place that also had cards and such. After looking at the envelops I could not find the european size envelops. I notices several empty spots and as the clerk about the envelops I wanted. Again a blank stare. A freind of mine obtained some at another store of the same chain. Turns out they are with the CARDS, not the office supply envelops. Leason learned is don't look in the office supply section for the european envelops, look in the greeting card section. Also the clerks that work in these store dont know what a european sized envelop is, all they know is they are the funny sized envelops they only sell to the crazy people that talk on the radio late at night!

1254. Alinco mobile 2m rig

Newsgroup: rec.ham-radio
Date: 1990-09-18 18:05:05 UTC
From: andrem@pyrman2.pyramid.com
Message-ID: <127478@pyramid.pyramid.com>
Source record: 8465

Has anyone heard anything, good or bad, about the Alinco 2m mobile rig? I forgot it's model number. I believe it has 45 watts and extended receive coverage. My one previous experience with Alinco (I bought one of their original 2m ht's) left a little to be desired. This mobile rig looks to be a good buy if the quality is reasonable.

Any comments would be appreciated.

1255. High-tension towers

Newsgroup: rec.ham-radio
Date: 1990-09-18 18:36:54 UTC
From: obrien@aero.aero.org
Message-ID: <85934@aerospace.AERO.ORG>
Source record: 8466

I just passed the test for my ticket and am contemplating getting a nice TS440 to begin operations. However, I don't want to spend close to $1200 on something that will be a warm paperweight. Not that that model's junk, mind you - my problem is environmental.

I live in Venice, CA, about three buildings away from a major boulevard that's got a nice line of high-tension towers marching down it. I can hear the corona discharge buzzing from my bedroom, and broadcast channels 2 and 4 are pretty "sparkly".

Just to test the waters I threw a rudimentary longwire onto an old Hallicrafters I have lying around, and was surprised to be able to actually copy a few QSO's. They all seem to be local, but that's not surprising. I didn't hear a great deal of hash. I got WWV OK.

The question: Can anybody give me some idea of what to expect in the way of a QRN spectrum from those #*$@(&$# HT lines? I mean aside from the cancer, that is...

I own the house so I can put up pretty much any kind of antenna - no covenants in a neighborhood THIS old! But if I can expect all DX to be wiped out, mebbe I better concentrate on running mobile.

From: phil@ux1.cso.uiuc.edu
Message-ID: <30500736@ux1.cso.uiuc.edu>
Source record: 8467

Maybe we should ask the question: "why is NON-aviation NOT using AM?"

The narrower that FM gets, the less capture effect you get.

When two stations double on FM, they get all kinds of squeaking and howling noises, so the heterodyning problems of AM stations doubling is comparatively not so bad. At one time, land mobile and amateur FM was wideband, and the advantages of FM were good, and the frequency stability of small portable units was so bad as to need that much band width to even find the signal. Today we have the technology to slice out the correct H3E or R3E signal, if we were to use these modes (H3E is AM with one sideband gone, R3E is H3E with the carrier reduced requiring a syncronous detector).

I guess that's what they stole 220-222 MHz for (narrowband use) but it seems that they have failed in making it work (UPS wants to use narrow packet, not ACSSB and voice).

Let's face it - none of us like to think about it, we hope it will never happen in our lifetime or that of future generations. But just in case, it's important to know...
Does anyone have any sources of information on radio propagation and effects on the ionosphere after a nuclear explosion or on a larger scale - during a "nuclear winter" ?
With all other services down, I would imagine Amateur Radio would be one of the only sources of communications.
Normally,I don't like bringing up old issues but while we're on the subject - was the context of the tape that was to be played on all Radio and television networks in the event of a nuclear attack ever made public either here or anywhere else ?

I've heard the navy wanted N, and apparently got it... all of it. The Army (and later Air Force as well) were using A.

I guess that the US got stuck with some weird letters in exchange for having so many letters.

On the other hand, all of M for such a small country? But then again they were quite an empire at one time.

One can see some obvious things in some of the call prefix allocations.

jgd@rsiatl.UUCP (John G. DeArmond) writes:

>- let the people who have a problem with software in
>this group fix the problem for themselves.

Passing the buck is not the same as solving the problem. It's no
sweat off your back to say "too bad" to others, is it?

>If someone running a mail gateway, say Brian for instance, thinks that
>his downstream sites would be so offended by or so driven to poverty by
>the transmission costs of software or other files in this group, then let
>that person fix the problem.

We are not talking about Brians opinion, we're talking facts. It is
unfortunate that your narrow view of the world only encompasses
Usenet. If you investigated the history of rec.ham-radio, you might
be surprised at the number of people who receive this newsgroup
via email. You might also be surprised to learn that the mailing list
was around long before the newsgroup was. And yes, some people DO pay
real money to read this traffic. (I have to wonder why sometimes.)
How do you suggest that those "driven to poverty" "fix the problem?"

>It is trivially easy to screen traffic on
>the basic of a) size and/or b) content (the leading "M" in uuencoded
>files is a dead givaway) and/or format (fixed length lines, for example).
>Using Deliver, that would be a 15 minute task. Then the rest of us who
>value such postings could continue to benefit from them. Of course, it
>IS much easier just to bitch about it....

Alright John, why don't you prove your point. Since it's trivial,
write the piece of code that will screen out source and binary postings,
and mail it to Brian. Please ensure that your program catches C, Fortran,
Pascal, Assembler (680x0, 80x86, 65xx, 68xx, Z80, 808x, VAX, Sparc, IBM 370),
and BASIC, in addition to uuencoded stuff. Oh yes, don't forget btoa.
We'll test it by letting you post your code to rec.ham-radio after Brian
installs the filter.

>Most hams use PCs and for the non-PC software, a
>simple keyword in the title line will differentiate it from the PC stuff.

Do you have any hard data to back that statement up?

> This group would be an ideal place for Phil's latest TCP/IP stuff as
>well as all the other ham oriented software. Perhaps Bdale could even be
>pursuaded to set up an automatic poster daemon for the IP stuff.

Have you met my friend John? What a guy! Always willing to appoint someone else to a job that will me his life easier! Tell me, John, do you know how many bytes of traffic would be involved if we were to transmit every update of NET and NOS (not to mention PE1CHL and the variants)? Get back to us when you do.

It sounds to me like John's ftp command is broken. To quote my most knowledgable friend, John:

">- let the people who have a problem with software in
>this group fix the problem for themselves."

>I say
>this, of course, because he stated a couple of years ago that it would
>take too much of his time for him to do so when I asked him to set up an
>automatic E-mail posting to me so I could redistribute to non- Internet
>sites.

So why didn;t YOU set it up?

>So here's my suggestion. In the interim, continue posting to rec.ham-radio.
>And in that interim, let's find someone to volunteer to hold a formal
>discussion and vote for a software newsgroup for ham radio. Any
>volunteers?

Ah yes. "I think we (sic) should do this!" "I think we (sic) should do that!" "I want! I want! I want!" "Who's going to do it for me?"

Here's my suggestion:

John, shut the fuck up!

|>
|> 73 de WA2ISE

As far as I know, K is used by stations west of the Mississippi and W by those east of the river, with one or two exceptions here and there. And then Canadian stations uses prefixes of CN (I believe) while stations in other countries don't have any callsign. I do know one example though. In Taiwan, there is a station named International Community Radio, Taipei which used to be the american military broadcasting station has a callsign of ICRT. (It broadcasts in English, most of the time). Therefore, I t

hink callsigns are only used by stations in North America.

Ben, DL6RAI

The decoupling effect of bringing your coax et al down to the ground level of the tower presumes that ground level is also rf ground level and thus no rf will be conducted. As you discovered, that is not always the case.

Your coax and rotator lines may be acting as radials. RG213 size ferrite cores are fairly common, available from most ferrite core manufacturers (e.g. AMIDON), RADIO KITs in New Hampshire, some RADIO SHACK stores and many stocking distributors.

You may also try creating an air core rf choke by winding the coax feedline - about 6-12 turns (the lower the frequency you are trapping out = larger number of turns), 6-inch inside diameter - to form an rf choke after the coax departs the base level of the tower. Another method I have found effective in years past is to electrically and mechanically bond the coax shield to the tower at the base. The tower base should be grounded with one eight foot ground rod per leg close to the tower and another eight foot ground rod per leg at least six feet away from the tower - all rods connected to the tower base with 3/8-inch copper tubing or #6 ground wire. Although a physical connection is not usually required, I have found occasion when working with a hot tower that bonding was the only way to achieve the decoupling. A coax feedthrough connector (a long double female device with mounting nuts - can't remember the connector number) works well for this purpose when mounted to a small piece of right angle stock that is clamped to the bottom of a tower leg. If you want to get fancy with this arrangement, this is also a good point to use a gas discharge tube lightning arrester in lieu of the coax feedthru.

Any one of these solutions may cure your problem or all may be required. And there are no guarantees! Good luck and 73,

Wayne, KB6CSP

I don't know how the assignments were made, but I presume they were at
an international level *above* simply a telecommunications organization,
because they're used for more than radio/TV callsigns.

This first dawned on me last year when I saw a Thai Air plane with an
"HSxxx" number. Of course, I'd been seeing "N" on U.S. planes for years,
but it never occurred to me that there might be a link between those ID
numbers and the "N" used in ham prefixes.

So I await a definitive answer, also. Seems like it must be a "higher
authority" than the ITU--or at least a joint agreement between the ITU
and some other international organization(s).

Aha! another plane spotter! Ever since my kid days, I have been straining my eyes in movies that featured airplanes to see if a movie was indeed taken on location. Much fun. Also at airports.

Of course, back then, when you spotted a VS- plane you don't really know which of the six colonial outposts it was from. I never bothered to look for the HS/s -- too common a sight at the local airport :-) :-).

BTW, HS probably got assigned because at that point the country's official name was Siam.

>Is there a small non-dipole or a 70 ft.
>dipole that could fit the bill?

I really enjoyed my 40 meter dipole. Check your "Tune in the World...",
for the formula, but it was about 66 feet. It had the advantage of being
nearly resonant on 15 meters as well, and when 15 meters is open the DX
can be a real blast.

Actually, I averaged the length of a 40 meter dipole and 3 times a 15
meter dipole. Had reasonable SWR on both bands.

By the way, I have since ruined it. I thought that having 80 meters
would be nice, so I bought a pair of traps so I could make it a 40/80
meter dipole. Since the 40 meter traps act like an open circuit at
resonance, both 40 and 80 work fine. But the 15 meter capability is
lost. :-(

The GEnie Radio Round Table is well worth the cost of GEnie's Star Service monthly charge of $4.95. The Radio BBS is one of many conferences that will be available at no hourly charge - all you want for your $4.95. Keep in mind that the Radio BBS is but one of several features available in the Radio Round Table. There are a couple of dozen active discussions at this time, including the Middle East, Scanner Mods, a Newcomer's Corner and plenty more. There's a file library of radio-related files that has several hundred items available for download, as well.

The Sysop is Larry Ledlow, NA5E, formerly of 73 Magazine. He does a great job and the forum is well moderated, lively and informative. Some months ago, Havana Moon and I introduced the GEnie bunch to live DXing - something which is consistently found to be addictive and plenty of fun. GEnie now has monthly live DXing sessions and it has proved to be such a winner that Larry is planning to do a live session once a week.

By the way - I have no professional affiliation with GEnie - my comments are simply those of a happy customer.

I would recommend moving, for reasons other than the radio. If it is
buzzing that loud, something is definitely wrong. If you are a lot more
daring, you might get some incendiary devices.....[never mind]

> The question: Can anybody give me some idea of what to expect in
> the way of a QRN spectrum from those #*$@(&$# HT lines? I mean
> aside from the cancer, that is...

It may be varying with the weather, too. I can hear radio noise as high
as UHF coming from the primary lines going by my apartment. 160 meters is
useless most of the time, and 80 meters is much of the time.

> I own the house so I can put up pretty much any kind of antenna - no

Re: RF getting on the coax cables when shunt-feeding a tower.

My suggestion would be to:

#1. Connect the coax shields to the tower leg at the bottom. And:
#2. Make sure the bottom of the tower is at RF ground potential.
The easiest way to do this is to connect a couple (or more)
quarter-wave radials to the bottom of the tower. I realize so few
radials may not be suffcient to reduce ground losses, but at least
it should decouple the tower base and reduce your "RF in the shack."

>73 Ben, DL6RAI

Just skin back the outer insulation on your coax at the base of the
tower and bond it to the tower with a stainless steel hose clamp.
Pot the whole joint with roof cement to waterproof the connection
and no more RF on the cables. This also helps protect your shack
from lightning. An even better solution would be to use a commercial
lightning supressor at the tower base since that has an arc cartridge
to protect the inner conductor as well. Rotor cables can be bypassed
with .001 caps from each lead to the tower base ground. Again, commercial
lightning supressors are available for these cables as well. I've
shunt fed my tower, 60 feet with tribander on top, for 80 and 160
meters and it works well.

Source record: 8411

In reply to Paul, yes, electret capsules of the type sold at Radio Shack and elsewhere have a built-in FET preamp- sort of a solid state cathode follower. I've seen two types: One has two wires, and requires DC to be supplied on the signal lead, with a blocking capacitor between that lead and the output. The other type has three wires, and appears to have a built in blocking cap.

I've used these capsules in many rigs, from my long-gone DX-Handy to various HTs. But let me suggest that the *optimum* microphone for your Ten-Tec is not an electret- though Ten-Tec sells them- but a good ol' Astatic D-104. I've never had such good audio reports as when I use this combination.

Some time ago I promised this group a review of the DIgitrex all-HF QRP rig when it finally arrived. Well, after numerous delays for parts availability, problem fixes and so on, I finally cancelled my order about 10 months after I placed it. They are supposedly shipping now, and a friend still has one on order, so I'll still try to post his comments if and when his arrives.

In the meantime I found a used Ten-Tec Argonaut - an early one, judging from the SN- that I've been having a bit of fun with. 2 watts output on 80-10 SSB is a bit of a challenge. I've been playing with microphones in an attempt to get better audio, but the best I can get is "you sound like you're holding your nose under water". Anyone have experience playing with these? My next step is to wire up one of my D-104s, but this seems a bit large for what is intended to be (for me) a battery-portable rig.

In article <275@aupair.cs.athabascau.ca> lyndon@cs.athabascau.ca (Lyndon Nerenberg) writes a good, if somewhat inflammatory, response to John DeArmond's call for continued software postings here. (Pot calling the kettle black? What, me flame? :-)

I, too, get this group by mailing list (not here, but at work). Software postings to the group fill my mailbox with no useful result. I'd like to see programs distributed by some other method.

Still, Lyndon's posting has one flaw:
>It sounds to me like John's ftp command is broken.

Not everyone has FTP access, either. There are Usenet groups for software distribution. Why don't we use them?

I don't know if there's a formal agreement between the ITU and the
International Civil Aviation Organization, which assigns aircraft
prefixes. I suspect it's more along the lines of "if you don't have a
preference, we'll use the same one." There are some differences between
the two lists, most notably in the Communist world.

From: scxc3@tincan.sawyer.af.mil
Message-ID: <9009191335.AA11080@tincan.sawyer.af.mil>
Source record: 8415

I have travelled quite a bit carrying my HT in my briefcase. I have flown on both military and commercial flights. The only request I have had was from MAC Medevac flights to remove the battery pack from the radio. I have had both my Icom IC-2AT and Kenwood TR-2600 X-rayed dozens of times at airports, with no ill effectsathat I can determine. (It has never bothered my film either). I have even sat in the waiting areas and chatted on local repeaters whaile waiting for my plane. I have been through Atlanta, Portland, Memphis, Mobile, New Orleans, Denver, Seattle, Dallas-Ft Worth, Minn-St Paul, Tampa, Orlando, and numerous other airports. I have demonstrated the radios several times, but only as a curiosity factor, never because there was a concern over the equipment. I also have never been told I could not operate the radio on the aircraft, but then again, I didn't ask or try. (Please let's not start up again about using radios on airplanes.)

My travelling has slowed down the past year or so, so there may be some increased paranoia at locations I haven't been to lately. Your mileage may vary. Maybe I have just been lucky over the years and haven't gotten a hard case security type.

At any rate, I would continue to carry my HT in my carry on stuff and use the appropriate discretion in using it.

73,
Michael

With companded SSB, the pilot signal isn't a reduced carier, but a tone.
(not at the "zero beat" frequency).

According to one of our local experts, it works well for point to
point. With mobile, you can get signal phase reversals from the
constantly changing multipath and your audio just goes "splat" (his
term) whereas with FM you would just get a click.

Well, I've worked as an avionics technician for about 4 years, including work on corporate jets that often fly internationally to Europe, Asia, Russia and South America. The standard for voice communication is VHF (118-150 Mhz) AM communications.. The only place FM is used on aircraft communications is on long range HF for ocean crossing and Flitephone. I'm not even sure the HF radios are FM...

While FM is a fine idea, at the present with "cheap" radios costing $3000 for general aviation planes, the cost of retrofitting to change would be way more than most owners would pay. BY the time the radios were installed and signed off, it would cost $6000-8000 per plane and the "old radios" would be worthless so there would be not trade-in to help defray the costs. Despite the view that all plane owners are "fat cats" most are just average joes, and many general aviation planes are worth less than $25,000 so this would be a very heavy burden. Of course we could demand retrofit of anticollision airbags to all cars!

I am working on a project at the University of Oklahoma. I need input
and this seems to be an efficient method to hear from people who know a
little more about electronics than I do (I'm an ME). We are developing a
portable, 100W remote power system that couples wind power and photovoltaics.
If you can spare a few moments, please answer the following questions...

1. What can a 100W system be used for? (camping, military, etc.)
2. Would you recommend 12V or 24V system? Why?
3. What would you consider to be maximum allowable weight? Why?
4. Do you think there is a market for such a device?

Even if you aren't going to answer, thanks in advance for reading this
far.

I have an HP 8558B Spectrum Analyzer that has a blown first mixer diode.
Does anybody know which diodes would be suitable replacement. HP gets
big $$ for a replacement pair.

I believe the diodes are germanium because of their low (.34V) forward
junction voltage. They also have to be microwave, since the mixer
operates around 2GHz.

Mike its a hard to say how bad the line noise will be at your QTH but thought I would pass along the experiences of a friend of mine.

My friend had high-tension lines directly behind his house. So close, in fact, that once when putting up a 65' vertical it came in contact with the lines (he was OK after several days in the hospital, but thats another story). He later put up a 70' tower with several yagis. He did have a fairly bad line noise but was able to make contacts easily. He entered a number of contests and was able to finish the the top 10 on several occasions. His line noise varied greatly from day to day, sometimes almost none, sometimes so much that most weaker signals were not readable. All in all, with a good antenna he was able to have a good time on the HF ham bands.

If you are planning to buy the radio, to run at least mobile anyway, it would be easy to put up a small inexpensive antenna (dipole) and see how bad the noise is before investing in a larger antenna.

Hope this helps,

I have owned an ICOM IC-2AT and currently an ICOM IC-32AT. I have always carried them on board in plain view without any trouble. I have had them x-rayed with no apparent problems, but normally, I simply hand it over for a visual inspection. Since the bombing in Scotland, many times they will ask that I power it up and unsquelch it to demonstrate that it is real.

Apparently, now with the proliferation of portable cell phones, the airlines are concerned with persons attempting to "make phone calls" during flights. I had one flight attendant ask if it was a cell phone. I assured her that it wasn't and that I had no intention of operating it during flight. That seemed to calm her down.

Julian Macassey gave a very nice explanation of the reasons for the
decline in kit popularity.

Bill Gunshannon then asks:

>I am not saying HEATH should have been cheaper cause it was a kit.
>
>I am asking why it costs MORE than a comparable piece of equipment
>designed and built buy the same off-shore companies.

I suspect that the extra cost is due to 1) the time it takes to package
and check all of those little bags of parts and 2) the time and effort
that goes into writing an assembly manual that anyone can understand.

>Pull string taut and presto! Wireless, no-power voice transmission!

Well, it may be wireless, but it isn't "no-power"; I've used examples of this system, and it's been my experience that the transmitters at either end must be periodically fueled to keep it running. A cheeseburger was the fuel of choice, with a chocolate shake or a Coke for lubrication.

(There also seemed to be a need to periodically take the transmitters off-line, apparently to drain used lubricants. The transmissions would become increasingly garbled and unreliable if this were not done.)

According to the FCC Rule Book, anybody can apply for a U.S.
radio amateur license, citizen or not. The only exception is for
"representatives of a foreign government". As long as you aren't
attached to an embassy or a consular staff you should be OK.

>
> Is there a small non-dipole or a 70 ft.
> dipole that could fit the bill?

Consider a dipole center fed with open wire or twinlead. Then use an
antenna tuner with a BALANCED output to tune it. You could make the
wire 1/2 wave on 40 meters (about 65 and a half feet), or you could
make it non-resonant and just extend it to the full 70 feet, and possibly
it will tune to 80 mtrs as well. If it doesn't tune to 80, you can
take the feeders and short them together, fed from the unbalanced
tuner output. This will operate as a Tee, or a vertical wire with
top loading.

If you use balanced feeders (like the popular 450 ohm ladder line)
you should be able to tune it on all of the Novice bands. This is the
classic multiband Zepp antenna, and you wont need any fancy traps or
multiple wires. On 10 meters it will be somewhat directional.

I am a new Ham and am getting my feet wet in the VHF and UHF sandbox. I have converted a TV rabbit ear to a 2m dipole which seems to work fairly well. (Anything is better than the ducky which comes on the IC-24AT.) So now I want to build a 70cm dipole and thought the same approach would work. But I have some questions which were not answered by the HANDBOOK.

1) I have been told that the overall length of the antenna should be the half-wave length, yes?
2) At what point does the o.d. of the antenna elements become significant WRT frequency?
2) What is the relationship of the distance between the feedpoints to anything.
4) I read somewhere that the 70cm antenna has a much smaller signal collection area, so a dipole isn't a good idea. That a multi-element beam is better simply from the standpoint of "collection area".

Thanks for any help you you can offer.

>they are x-rayed?

X-rays can cause crystal defects in IC's. All things being equal, the
denser the circuit, the more prone they are to damage. As far as I
know, the effects are cumulative, so the upteenth exposure is more
likely to cause failure than the first. Arguments from the attendent
that the dose is near zero don't wash as long as they have the warning
sign to keep your hands out of the machine

For me, calculators*, electronically controlled cameras, etc are strictly
hand search or lead bag.

*The calculator part is left over from college days when my calculator
represented a huge investment. Now it wouldn't hurt me so much if one
died.. the risk is there, but the loss is less.

> (not at the "zero beat" frequency).

You can compandor the signal in any modulation mode. They chose to do it with SSB to help overcome the problems if interference. By having the variations in level be logarithmic instead of linear, the linear form of interference will be reduced upon uncompandoring.

Compandoring needs some sort of reference signal to set the levels to match the received strength. The pilot tone can do this better than the carrier since it can be set further from the audio, making separation easier and allow for poorer frequency tolerance. Now that you have a pilot tone, it can also server as the "clarifier" reference, and so the carrier is no longer needed. "ACSB" is the tradename owned by Aerotron, Inc., for their version of ACSSB that includes the pilot tone around 3.7 kHz. This is the narrowband mode they proposed to the FCC.

ACSSB and ACSB are NOT an R3E or H3E mode, but are really forms of J3E since the carrier is totally absent.

> According to one of our local experts, it works well for point to
> point. With mobile, you can get signal phase reversals from the
> constantly changing multipath and your audio just goes "splat" (his
> term) whereas with FM you would just get a click.

It can drive the compandoring nuts, I guess, since there would be some delay. Also the "auto clarifier" or "frequency lock" could get upset, especially at phase crossover.

I would like to encourage amateur experimentation with R3E and H3E. There might be places it is useful. If there are any, shouldn't WE be the ones to find it?

I would also like to see SW broadcasters make use of H3E on 5 kHz spacing. They could get a lot more stations in the bands they have with less mutual interference. If they settle on a particular sideband (such as upper) then a lot of the interference problems can be eliminated, such as overlapping sidebands from some of the exist 5 kHz spacings.

1300. Limited space antennas

Newsgroup: rec.ham-radio
Date: 1990-09-19 22:33:31 UTC
From: plb@dcdwest.uucp
Message-ID: <1990Sep19.223331.5265@dcdwest.uucp>
Source record: 8336

Help!
After being inactive for ~10 years all of a sudden this ICOM-735 shows up
on my door step in a basket wrapped in a blanket (well almost).
Now this looks like a pretty nice little package and I'd love to use it but
I live in area where VISIBLE external antennas are a no no and therein lies
my problem. I've considered a few options to get back on the air which
follow and I'd appreciate any and all comments from knowledgeable sorts as to
feasibility, performance etc. by e-mail. If enuf responses are rcvd I'll
summarize to the net.

1. Is an attic installed limited space antenna a VIABLE solution for
10-80 meters e.g. a trapped dipole etc?.

2. Anyone have any experiences (good/bad) with the AEA ISOLOOP
either outside or in an attic?

3. In the problem description above I said VISIBLE external
antennas. Is it feasible to install a 10-80 meter VERTICAL on a
crank-up tower at the back of the house (against the house, not
in the yard) and crank it up above roof line after dark?
I seem to remember that verticals require good ground radials
still true?

4. Any other good solutions out there?

Thanks much and 73's

The title pretty much says it.. What is on 144.383, whatever it is it's pretty strong in the SF bay area. I hear it on two very different rigs in locations 40 miles apart. Sounds like some kind of telemetry.
Anyone know?

Electrets are indeed very high impedance and are coupled with a FET used primarily as a impedance transformer (source follower). Some electret microphones then follow the FET with a preamp, some don't. I know that the Icom and Yaesu headsets DO use a preamp following the FET. The preamp is located in the push to talk box while the FET is physically mounted with the electret element. There is a gain control on the preamp accessable through a small hole in the switchbox. Running the preamp at reduced voltage will indeed cause lots of distortion.

I owned one of the DR-110T's, and my only complaint was getting some intermod on several of the 2-meter frequencies when I was in high RF areas. However, this is a common occurrance with the broadbanded front ends that most of these modifiable receivers have.

I currently have their dual bander DR-510T. It is a great radio! The DR-510 like the 2-meter model can cover the 350-370 and 850-890 (I think that's right) band, so if you have trunked 800 mhz services in your area, you're able to receive these stations.

I can honestly give my DR-510T an A+ for operation, and I'll be buying more Alinco products as their customer service appears to be very oriented towards helping people.

1305. Earthwinds Balloon

Newsgroup: rec.ham-radio
Date: 1990-09-20 02:35:20 UTC
From: DXANDY%widener@UCSD.EDU
Message-ID: <5A0913151301033E-MTABWIDENER*DXANDY@widener>
Source record: 8337

I was reading an article in Popular Science this morning about the attempt to circumnavigate the globe in a helium balloon. Apparently, the balloon, called Earthwinds, will be transmitting on the amateur bands. The article only mentioned this in brief and gave absolutely no details. Does anyone know what bands/freqs. the balloon will be using?

While you folks are digging back in your old QSTs looking for the earliest callsigns in the current series and all those other good things, can anyone tell me roughly how the total number of DXCC countries has changed over the years? I've been on the air for 3 years from this country, and during that time there have been several new countries added (Aruba, W. Sahara, Rotuma, Unpronounceable Island [4J1], Conway Reef, Banaba Island, Walvis Bay) and no deletions (we expect some deletions soon, due to mergings of the Yemens and Germanies, just as we expect more new ones, but I think the official score in the last 3 yrs is 7 added, 0 deleted). Is this just statistical noise, or have new ones been added at a faster rate than others have been deleted? I know that the current total is 324, and an article in QST earlier this year suggests that another 50 have been on the list but are now deleted.

I think it's obvious that regardless of the DXCC rules, there have been more 'political' countries created over the last few decades, by declaring independence, than there have been deletions by mergers or conquest - and while we are talking trivia here, Namibia was the 160th member of the United Nations earlier this year. For those hams who like to work "real" [U.N.] countries there is such an award (it comes in various levels, I have the #1 U.S. award for 120 U.N. countries, which says more about the obscurity of operating awards than it does about my DXing abilities :-))

So, do any of the OTs remember how many countries there were when DXCC was first started (obviously more than 100!), when did the total reach 300, etc? (No flames about how silly country chasing is, that's not the issue!)

I've designed them into telephone circuits, and used them with radios. They are not my favourites for communications for several reasons: They are very sensitive to RF. They are Hi-Fi - cover lows and highs - not good for comms, especially in a noisy environment. They have no "threshold", unlike carbon mics, they will pick up noise a room away.

They have the following in their favour: They are cheap - $00.30 in quantity, carbons and dynamics cost about a dollar or more. They are small and light.

>
> The Paragon (since Tentec sells electret microphones) has a low-level
> (about +8.4 VDC through 680 ohms) voltage available on one of the pins
> in the microphone connector.
As I recall, depending on the model, Electrets want between 1.2 and 4.5 Volts MAX. They are polarity sensitive and just a sniff of voltage is all you need. Plantronics headsets, which use an electret, as I recall work fine with 3V though anything from 1.5 to 15 seems OK.

> Rather more recently (the last few months I think) I saw something
> on electret type microphones, and I believe (can't quite remember enough

Yes, they all do as I recall. Also as I recall Panasonic seems to make most of them. There are 2 wire and 3 wire versions. The 3 wire are nifty cos you can use a seperate battery to power the mic and run the mic leads straight with no DC blocking etc. Rat Shack used to carry these mics somewhat over priced. You can salvage them from dead cassette recorders and answering machines, let alone dead $10.00 junk phones.

I would say the voltage is too high and the electret output may be overdriving your mic preamp. Plus, don't forget to RF proof that mic.

Bypass at the element with a 1 Nf cap and try ferrites and chokes on
the leads.

Isn't playing with audio fun, you can hear how you are doing -
instant feedback.

Maybe the University ham club should be able to answer this. They should have the info.

> Are there any kind of restriction on non-immigrants (I
> am here in the States on a student visa) applying for
> a ham radio license?
>
I suppose next to "Can I take my walkie-talkie on a commercial flight?" this is the next most often asked question. As the resident wetback I can answer:

Simply put, if you are not an agent for a foreign government and can produce a real photo ID (Passport, Drivers Licence, Student ID etc) you can take the exam. You don't even have to be in the US or have a US address to take the exam. So if there are any volunteer examiners amongst US troops in Saudi Arabia, they could administer exams for the locals so they could get US call signs. They may not be able to get Saudi Call signs and US citizens may not be able to get Saudi licences, but that is life and bureaucracy. It is also why I like the US so much. Civil servants in the US are here to help you not thwart you as they seem to want to do in the rest of the world.

Take the exam, get the licence, have a hobby for the rest of your life.

>via email. You might also be surprised to learn that the mailing list
>was around long before the newsgroup was. And yes, some people DO pay
>real money to read this traffic. (I have to wonder why sometimes.)

Interesting, Lyndon, that you'd be speaking so learnedly about the
net, resource management, costs, and responsibility, considering
that you are posting from a freeloader account at a university.
Perhaps when you grow up, get a real job and pay some of the bills
yourself, you'll perhaps qualify to express an opionion that matters.

In case you are wondering, rsiatl.uucp is owned my myself and one
other person. We bought the equipment. We pay for the phones and
electricity. WE pay the long distance bills. And you know what?
I don't mind at all transporting data through my system that I have
no use for. It pleases me to know that I've served someone else's needs.
I guess you don't learn that concept until you attend the School
of Life for awhile.

>How do you suggest that those "driven to poverty" "fix the problem?"

Take some remedial classes and learn to read. Then reread my posting.
You'll get it eventually.

>Alright John, why don't you prove your point. Since it's trivial,
>write the piece of code that will screen out source and binary postings,
>and mail it to Brian. Please ensure that your program catches C, Fortran,
>Pascal, Assembler (680x0, 80x86, 65xx, 68xx, Z80, 808x, VAX, Sparc, IBM 370),
>and BASIC, in addition to uuencoded stuff. Oh yes, don't forget btoa.
>We'll test it by letting you post your code to rec.ham-radio after Brian
>installs the filter.

That's very easy, Lyndon. I won't fix the problem because I don't have
one. If I DID have a problem with net content, I WOULD fix the problem.

>>Most hams use PCs and for the non-PC software, a
>>simple keyword in the title line will differentiate it from the PC stuff.

>Do you have any hard data to back that statement up?

Idiot.

>> This group would be an ideal place for Phil's latest TCP/IP stuff as
>>well as all the other ham oriented software. Perhaps Bdale could even be
>>pursuaded to set up an automatic poster daemon for the IP stuff.

>Have you met my friend John? What a guy! Always willing to appoint someone

>many bytes of traffic would be involved if we were to transmit every update
>of NET and NOS (not to mention PE1CHL and the variants)? Get back to us
>when you do.

Why don't you tell us. And then point out to us how much incremental
load that would be. I handle upwards of 40 mb/day through this system.
I suspect an addition meg every little while would not even be a blip
on my load map. I should not be too awfully hard on you for not
knowing this answer. After all, it's not your system.

>It sounds to me like John's ftp command is broken.

Works quite well, thank you. That is, when I have time to muck with
it. I don't have the liberty to sit around at others' expense babying
an interactive ftp session. It's much nicer to find the stuff already
on the machine compliments of that mystical, magical system called
usenet. And if I don't want it, expire and rm work rather well on
my machine too.

> ">- let the people who have a problem with software in
> >this group fix the problem for themselves."

>>I say
>>this, of course, because he stated a couple of years ago that it would
>>take too much of his time for him to do so when I asked him to set up an
>>automatic E-mail posting to me so I could redistribute to non- Internet
>>sites.

>So why didn;t YOU set it up?

To take your position for a moment, why should I? Not my problem, man.
I have Internet access. It's the people downstream of me who DON'T
have internet access who would benefit from such a service. To take
my position again, I'd be glad to set it up. Lots of work to set up
a cron job. Oh, I forgot, they probably don't let you use complex
utilities like cron. RTFM. Oh, one other thing, I'm sure that
if Bdale has a problem, he can speak for himself. I'm sure he
does not need a flatulant mouthpiece such as yourself doing it for him.

>Here's my suggestion:
> John, shut the fuck up!

Such elegance, such grace, such mastery of the English language. I'm
impressed. Tell us more, Nerd-berg.

1311. Looking for Intro/FAQ info on packet radio

Newsgroup: rec.ham-radio
Date: 1990-09-20 07:32:10 UTC
From: dayger@penelope.Oswego.EDU
Message-ID: <1990Sep20.073210.11479@oswego.Oswego.EDU>
Source record: 8341
Cross-posted to: rec.ham-radio,rec.ham-radio.packet,rec.ham-radio.swap

OK, I hope you read the summary line above. Here goes:

I've used networks, online services, and BBS's for years, but I've never really paid much attention to packet radio. This may change... depending on what kind of feedback I receive.

Basically, I'm starting from scratch, and need to have some idea of where to begin. I have a list of rudimentary questions like:

1) Just what *is* packet radio?
2) What kind of equipment due I need, and how do I use it with my PC?
3) How much technical (hardware) proficiency is requied to manage a packet radio system? (I have a general understanding of computer hardware, but am more comfortable programming.)
4) Just what's out there for me to access via packet radio? (This is VERY important. I'm not interested in this as a pure hobby, I'm more interested in the resource potentials.)
5) How much will a packet radio set-up cost me? How COST EFFECTIVE is packet radio?
6) What legal issues do I need to consider regarding packet radio? Do I need a license?
etc.

Pointers to reading materials such as books and magazines that my campus or local libraries might carry would be nice.

Personal comments and insights into the world of packet radio would also be appreciated. I've tried reading the ham-radio newsgroups, but a *lot* of it is Greek to me.

Any packet radio operators from central New York out there??

Thanks in advance,

-Tim

Quarter Century Wireless Association recommendations in the matter
of FCC Docket PR 90-55:

"The Quarter Century Wireless Association, in consideration of the urgent need to bring many new persons into the scientific and engineering fields, because of the projected explosive, worldwide development in electronic communications and, in consideration of the significant role the Amateur Radio Service has traditionally provided as an entry to both technical and operational areas of electronics, physics, chemistry, engineering, and entrepreneurship, respectfully proposes modification of Part 97 of the Rules of the Federal Communications Commission to authorize an entry-class, no-code, Amateur Radio Service License. It is proposed that optional classes of entry-grade Amateur Radio Service licenses be adopted as follows:

Option 1. The Technician Class license would be retained with all present requirements and privileges retained except:

a: The Morse code requirement would be eliminated.
b: No privileges would be authorized below 30 MHz.
c. Special Group D call-signs would be assigned to all qualifying for the Technician class license issued without a Morse code requirement.

Option 2. The Novice class license would be retained with all present requirements and privileges retained except:

a. The name Novice class would be changed to Communicator class.

> medelma@waynest1.edu

I had an Argonaut a few years ago with this same complaint. As I recall I found two problems. An electrolytic capacitor in the microphone amplifier had "dried out" or lost value messing up the frequency response of the amplifier. And the radio was out of alignment. The filter was not centered properly, referenced to the carrier oscillator. This is the first radio I have ever found to be out of alignment without a component failure. Anyway it had fine transmit audio after these two fixes.

I also had a receive problem with this radio, the audio would drop to a low level and become distorted. A sharp rap on the case would bring it back for a while. It turned out to be an oxidized connector to the mixer board. If your Argonaut is an older unit, do open it up and clean all the connectors. This is good advice with any "modular construction" equipment since manufacturers tend to cut corners here and not use gold flashed contacts. The solder coated connectors used in most equipment reacts badly to the sulfur dioxide generated by the catalytic converters on newer cars. That "rotten egg" smell you often notice from newer cars is the precursor of sulfuric acid which will react with the lead in the solder and turn it a black lead sulphate rather quickly in urban areas.

This rig has fine audio when it's working right. The input impedance for the microphone circuit is 600 ohms while your D-104 uses a ceramic cartridge with an output impedance of 50,000 ohms. If you intend to use the D-104, you'll need an impedance matching circuit and probably a preamp. I use a D-104 on an old B&W 6100 transmitter and have always liked it's "communications" frequency response characteristic. This is not a "HIFI" mike by any stretch of the immagination. Most electret microphones have a very flat frequency response of "broadcast" quality, that's why we've changed over to them almost completely in the broadcast business. Impedance matching is critical to good frequency response so

please take all steps necessary to match your microphone to your rig,
you'll be glad you did.

This is so true. The only "all band" antenna that I know of that meets
your requirements was made by a company called Lattin Radio Labs in
Owensboro Ky. This was a 66 foot long multiband dipole tuned by stubs
with loading coils on each end for 80 meters. It was made of tubular
twinlead with shorts between the twinlead wires at the stub points.
It was a clever design and worked very well handling up to 1 kw on
all bands. I used one for several years until a storm finally broke
it. I haven't seen any ads for it in QST for some years and I believe
that Mr. Lattin has passed away. I thought of duplicating it using
12/2 house wire instead of twinlead but never did since I moved to
a QTH with enough room for a big antenna farm.

>Is there a small non-dipole or a 70 ft.
>dipole that could fit the bill?

One of the best all-band antennas is the center-fed zepp. It's a dipole fed with open wire feedline, and matched to the rig through an antenna tuner. I use one that is about 120' long, and it works very well on 160 through 10 meters. If you can make it 70' long, it should work well from 80 through 10. There is very little loss in this type of antenna system if you use good feedline. I have found that the commercial 450 ohm stuff is usually adequate. For me it worked fine on 80 through 10, but was quite lossy on 160 due to the extremely high reactive current in the feedline on that band. The commercial 450 ohm feedlines use #18 copperweld conductors, which wasn't adequate for the high currents I get on 160. I made my own feedline out of #12 wire, using 6" lexan dowels for spacers, and improved my signal on 160 about 3 - 4 db, but no perceptable difference on the other bands (I made field strength checks with a local ham before/after).

I have used this type of antenna at many different locations and have always had predictably good results with it.

Phil Blais asks about hidden antennas. Well, when I was a novice I ran 35 watts CW on 80, 40, 15 and 10 from an apartment using an antenna tuner and a very thin piece of enamelled wire running across the room, out a window and up a tree. Invisible, but not the best antenna I'd ever used. Worked, though. What I'd suggest, however, are the following:

1. Run twin-lead up to aTV antenna mounted on your roof (if *that's* allowed) and from the end, stretch a thin dipole made of black wire to handy trees. Length is not important; make it long as you can and feed it with a tuner.

2. Same trick in your attic. Run the dipole along the ridge and droop the ends to get more length.

3. For the higher HF bands, the AES antenna in your attic might be good.

4. Make attic dipoles from mobile whip antennas- the helical wound fiberglas whip type. Problem is narrow bandwidth on 80 and 40.

5. Run a loop aound your attic; feed with twin lead.

A friend of mine, confined to an apartment, had a very thin and nearly invisable 10 meter full-wave loop stapled to his outdoor porch, and fed with a tuner. He made a lot of DX on SSB and AMTOR, on 10, 15, 20 and 40.

My how lucky to find an IC-735 on your step. Boy I would love to find one like that. At any rate, you are in luck as the Icom AH-2 tuner is one of the best there is and it was designed specifically for the IC-735. Since you found the 735 on your doorstep, then your ham fund should be pretty flush and the tuner should be no problem :-) :-).

The AH-2 tuner will tune anything to any frequency. Run a short coax jumper from the tuner box out the window and hook it up to the rain gutter (assuming of course you have metal rain gutters) and tune away.

I have used rain gutters many times with excellent results, especially in extremely low profile operations. Granted, it was with the old Collins tuner and a KWM-2A, which is a little more forgiving, but I still maintained good communications over a variety of distances. If you lack metal raingutters, perhaps a wire loop around the building, or a good long wire run wherever it is out of site will do.

Good luck es 73,
Michael

If you have trees you have no problems.

1/4 wave at 80 meters is only about 60 feet or so. Build a vertical with wire and keep the wires close to the tree trunk and they will not be "visable".

QST had an article not too long ago about using a random wire tuner and a spike into a tree that would effectively use the tree itself as the antenna. The nice part about this type of vertical is that it already comes with its own radials :-).

Do you have a fence around your yard? Possibly you could set up a loop antenna around the top of the fence.

If you have a dog put up a zep and tell everyone it is a puppy run. (be sure to insulate the lead going to the dog ;-).

Are there lamp posts near your house? load one up, it may work. The lamp may turn on and off as you transmit so be sure to hide your antenna lead to keep the neighbors guessing.

when working with the above just remember that even though you may get a 1:1 SWR the antenna may not work resonate at all. (i.e. a dummy load has an swr of 1:1)

The only way to test for resonance is to hook it up and listen/transmit or use a noise bridge to determine the resonant frequency of your antenna and then trim it or change the feed point untill it works.

good luck

1323. International call sign assignment history

Newsgroup: rec.ham-radio
Date: 1990-09-20 14:14:33 UTC
From: wayne_a._lightsey.RochXRC@XEROX.COM
Message-ID: <900920-071456-2335@Xerox>
Source record: 8349

International call signs and general regulations governing various radio services (Fixed, Broadcast, Marine Mobile, Land Mobile, Satellite, Aeronautical Mobile, etc.) are established by treaty through negotiations conducted by State Department representatives. Ham radio, represented by the ARRL domestically and the International Amateur Radio Union (IARU) - an international lobby of ARRL-like organizations, is but one lobbyist at the WARC treaty meetings which come under the auspices of the United Nations.

At present, ARRL is preparing its views and is represented on the State Department committee formulating proposals for the upcoming WARC meeting. Ham radio is but one of many special interest groups lobbying. IARU is preparing worldwide proposals based upon input from ham radio organizations worldwide, etc.

The State Department representatives are diplomats and negotiators - not knowledgable technocrats in the radio communications field. Issues may arise at the negotiation sessions (whence ARRL, IARU, etc. are NOT present) that go beyond the scope of prepared materials. In such cases, our State representatives have agreed to changes without knowledge of the ramifications. For example, at the last WARC, a proposal was made to give a band of frequencies just above 4 MHz to Marine Mobile services. Having no prepared material (this was an impromptu proposal), State agreed - only to discover later that these frequencies are heavily used by the U. S. Military (including all MARS services). Although efforts are underway to renegotiate this point, the fact remains that it is law and if unchanged, the U.S. Government will have to relocate its military communications in this band to other frequencies.

It is more than coincidental that aircraft registration number prefixes coincide with radio callsign prefix designators - the aircraft numer is the radio callsign (except in the case of part 121 - scheduled commercial airline - flights where the flight number is used). Ships similarly carry callsigns, like land stations, that coincide with the radio prefix of their nation of registry. However, ships names long preceeded callsigns, so the registration number or name of a ship usually has nothing to do with the ships official radio identity. Informally, the ships name is used in radio calls but as with other stations, the licensed radio callsign is supposed to be given at appropriate intervals.

By international treaty, every radio station should have a callsign. Whether they broadcast it or not is a different matter. For example, few if any radar stations transmit their internationally recognized callsign - but they are all supposed to be licensed -- except, of course, those belonging to the military of various nations etc., etc., etc.

In the seventies, Kastrup Airport (Copenhagen) used to have an FM high band channel that carried tower to taxiway comms. It was a repeater crosslinked to the airband channel. The purpose of this was that ground crew could follow and communicate with the plane to ATC stuff on their Storno walkie-talkies. This is not FM air to ground but an interesting cross link, especially as this was about the only chance to hear English spoken on VHF FM comms stuff.

Still waiting for a list of countries that use FM for air to ground.

John
Sorry to post the reply but a direct reply seems to bounce.
I have an extra 8558-60004 first mixer assembly. I also have an extra
mixer board only but it also is missing the mixer (:>).
The diodes are no doubt Schottky and thus the lower junction potential.
I suspect that HP makes the diodes themselves. I might be able to
dig some up if I had a part number (I'd have to find someone on
the line that makes the mixer assembly or else thrash through a lot
of documentation). I suspect that a standard diode array from Metellics
or other manufacturer would also work fine. Should be under $10.

I read this in rec.humor.funny and I can not stop laughing / crying...

Taken from rec.humor.funny...

The following is an actual letter. The original
was typewritten, and all spelling and grammar has been carefully left
intact, including errors. I thought this was pretty funny.

To Mr. (name omitted)
District Manager for Alabama
Radio Shack
3300 N. Pace Blvd
Pensacola, FL. 32505

Dear Sire,
This letter is complain about the problems I have having with the ham radio
model number 19-1101 I had got from your company Radio Shack. I had this
shipped special to me from your store 1096 Eastdale Mall Montgomery
Alabama. I was got this because I think that i would get transmitt furthur
that I did with the TRC 217 40 channel walkie talkie.

The problem that had first was when I was going to hook this radio
HTX-1000 to the antenna the conektor on the radio was wrong it wouldn't
attach to my cable. I was able to hook it finally by making a small change in
in the connektor. As soon as I tried to use it there was no sound coming
at all. This happened for two days and I never did get to talk to anybody
the whole two days. That day the cable company came knocking my door and
said there was something causing problems at my house and disconnekted my
radio from the cable line. you knew when i brought the Radio that I was
going to use that for my antenne. You didn't tell me not to why not?

Next time I decided to put the HTX-1000 in my automobile I thought I would
see how it worked their. I hooked it to my CB-antenna and at least I
could hear people. But what happens now is no one wants to talk to me because
they says you have to have a licencs to talk to them. Why? I dont have to
have a licencs to talk on my CB. They'll talk to me there. Anyhow it dont
matter much anymore because somebody done took the radio HTX-1000 from my
automobile.

What I would like for you Radio Shack to do is refund my money because I
don't have the radio anymore and its not my fault i dont and I think you
should give me back my money. Also the cable company here says that I
hurt something in there line and want to be paid fix it. It will cost
$27482.98 to fix the equipment they say was damaged because you didnt
tell me not to hook it to the cable. Please remit to me the check for
$27758.53 for damages due. To save this matter from going to court the

check must be in my hand by June first or I will turn this over to my attorneys of law.

Thank you

name withheld

I am glad we settled that it *is* in a ham band. Otherwise ARRL
would get a pink slip, as they use that frequency for announcements and
code practice.

That in itself would keep anyone in the northeast from buying a 3.58
(or 3.5795..) crystal for contacts.

In laying out circuits, I sometimes cheat and see how the commercial guys did it on a similar circuit. Part of the problem of homebrewing is that you don't have the extensive design rules database that the commercial guys do.

I've never seen toroids laying on a ground plane in frequency-sensitive circuits.

1332. SWBC harmonics on 10 meters

Newsgroup: rec.ham-radio
Date: 1990-09-20 17:48:38 UTC
From: kb2glo@cbnewsj.att.com
Message-ID: <1990Sep20.174838.23661@cbnewsj.att.com>
Source record: 8425

This morning while driving to work I was tuning around the 10 meter band looking for a QSO. I had heard that 10 meters was doing pretty well over the last few days so I thought I'd give it a try durning my commuting time. Well I heard a lot of DX from Europe on the band and heard some classical music around 28.800. I wondered what jerk out there is playing music. Then I came across the carrier and realized it was AM. I of course figured it must be a harmonic and tuned to 9.600 MHz. I was right on my first guess. It turned out to be Radio Moscow. I was rather surprised of the S9 signal I was getting of their third harmonic with just a short Larsen 10 meter whip on the roof of the car. I called up the ARRL and reported the interferance to Luck Hurder which stated he'll be reporting it to the FCC. It appears he sends a monthly report of several hundred cases of interferance each month to the FCC. Of course we can't expect much to be done but at least it was reported. So I guess if you have one of those Uniden or Radio Shack 10 meter rigs and commute on the East coast you'll be able to enjoy Radio Moscow in the morning. I heard them from 1251 to 1300Z. They signed off at 1300Z and I don't know how early they were on... Happy listening :-(73 DE KB2GLO, Tom.

You must be a rocket scientist :) I've only heard stories about people doing this.... Neat stuff, though.

>I could think of big ferrite cores but where can I get cores
>that are big enough for RG-213?
>
>Any other ideas?
>
>73 Ben, DL6RAI

Maybe all the control cables on the tower are hot with RF. Try ferrite on ALL those cables before it goes into the shack. There should be a way to use a dip meter in absorption mode to see what cables are hot. It could be that the RG-213 is getting shield currents because the match is on the top. Are there ways to put the match on the bottom, and have less RG-213 on the tower ? My experience with 2-meter J-poles is that any feed line close to an antenna will develop RF on the outer conductor, which must be choked. Otherwise, you get screwy SWR depending on cable placement, not to mention less-than-clean patterns.

There is a linear choke described in the ARRL Antenna Handbook (or maybe the Handbook itself) that consists of a long mailing tube around the coax. The mailing tube is then stuffed with steel wool. Another possibility is making a choke out of a bunch of RG-213-sized cores - there are references to "bead baluns" in the Antenna Handbook. That sounds expensive, though.

Another possibility is to eat the .1 dB loss and use RG-8/X or (gasp!) RG-58/U on the tower or for the choke section.

Good luck. I'm amazed to hear of people actually shunt feeding a tower !

I was unable to mail to you direct. Please respond to this note in order to acknowledge receipt. Otherwise I'll try other methods...

Ken...

Hi Bob,

Primary repeaters in the Colorado Springs area would include:

146.97 (Pikes Peak) {wide area coverage}
147.03 (Cheyenne Mtn) {open, but with private patch facility}
147.345 (Cheyenne Mtn) {open, but with private patch facility}
146.910 (location?) {open, Springs link to "Colorado Connection"}

In addition, 146.52 is a very commonly used simplex channel here. Your best bet would be the '97 machine as most of the locals use it a great deal more than others. In emergencies, you may be able to get a member of the two patch machines to dial for you. They are usually happy to help out.

The Colorado Connection is a system of linked repeaters throughout much of Colorado. System quality is marginal-to-adequate, but use is free.

If you are able to spend some extra days I would suggest taking the time to drive up Pikes Peak (14,110'), drive through the Garden of the Gods, or out to the gold camp of Cripple Creek. There is good shopping along the main street of Manitou Springs. This time of year is also the primr time to observe the aspen trees turn their fall colors.

Hope to here you on the air... 73 Ken

I agree that programs should go to the existing binaries groups. Now with that out of the way, I don't see the problem with mailing lists other than the volume running up the phone bill. At least at my site, I can read mail one page at a time with mailx or I can save without reading the mail to the mbox and use vi on the mbox to read the parts I want to read. I save out the parts I'm interested in and delete the rest. Surely anyone with any reasonable Email system can do the equivalent of this.

From: andrem@pyrman2.pyramid.com
Message-ID: <127702@pyramid.pyramid.com>
Source record: 8331

Since making a request for information on the Alinco DR-110T 2m mobile transceiver, I've received a couple of requests to post any comments I receive. I got three responses from hams who have first-hand experience with this rig. Comments were very favorable on the whole. The only problems indicated were susceptability to intermod in high-RF areas (but no more than similar radios from other manufacturers) and difficulty in seeing the LED display in daylight.

The comments were favorable enough that I drove up to Ham Radio Outlet in Burlingame to get one. They had the DR-110T on sale for $289.99. I also found the DR-112T (same as the DR-110T but with an LCD display) for $319.99. I decided that being able to see the display in daylight was worth the extra 30 bucks and walked out with the DR-112T.

The radio is nice and compact. I haven't had a chance to hook it up yet so I can't vouch for its performance. If anyone's interested, I'll post a review of the radio after I've given it a workout.

By the way, one of the hams who replied to me gave me the mod to get extended coverage. I assume that it has probably already been posted here so I won't repeat it unless I'm requested to do so. I won't try it myself until I'm satisfied that the radio is fully functional (wouldn't want to void that warranty too soon).

>some questions which were not answered by the HANDBOOK.
>
>1) I have been told that the overall length of the antenna should be the half-
> wave length, yes?

The overall length of a half wave dipole is approximately a half wavelength.
There are other effects that come in to play, end effects, etc, but basically
it's a truism that a half wave antenna is a half wavelength long.

>2) At what point does the o.d. of the antenna elements become significant
> WRT frequency?

The rule of thumb is that while the length to diameter ratio is 1000 or
greater, the diameter is unimportant except in a structural sense. As
the antenna becomes "fatter" than 1000/1 the bandwidth increases. Eventually
this can reach a point where the resonance peak becomes so small that you
have a nonresonant antenna for all practical purposes. An L/D of less than
10 would be an example of a nearly nonresonant antenna.

>2) What is the relationship of the distance between the feedpoints to anything.
>4) I read somewhere that the 70cm antenna has a much smaller signal collection
> area, so a dipole isn't a good idea. That a multi-element beam is better
> simply from the standpoint of "collection area".

If the feedpoint separation becomes an appreciable fraction of the length of
the dipole, say 5% or more, then the directional properties of the antenna
will change. On the subject of capture area, given two dipoles, one cut for
say 100 Mhz and another cut for 200 Mhz, the 100 Mhz antenna will present
twice as many microvolts at the feedpoint than the 200 Mhz antenna for the
same transmitted strength. This is because the 100 Mhz antenna is twice as
large and intercepts twice as much of the wavefront. Signal "path loss" is
said to be inversely proportional to frequency due to this effect. If you
erect two dipoles side by side in a broadside array at 200 Mhz, their
combined feedpoints will deliver the same number of microvolts as the 100
Mhz antenna, neglecting matching losses, while being the same physical size.
Similarly, a classic yagi of two elements would intercept the wavefront
twice and give the same result. There is one fly in this ointment however,
the radiation pattern of two half wavelength sections will be different than
a single section. The antenna pattern will become more directional as elements
are added, exhibiting "gain" in a preferred direction. This gain will be
proportional to the physical size of the antenna array. The actual physics

of antenna radiation is more complex than this, but this is a convienent way to think about the situation.

Re: dipoles

70' is almost ideal for a 1/2-size G5RV. It's mostly resonant, so you
may avoid buying a transmatch. It is resonant on 40, 20, 15, and 10.
As a novice, I don't think you can use 20 and 15 CW, but it gives you
incentive to upgrade to tech. :)

The G5RV can be bought as a kit, but if you can find an Ernie, you can
probably build one for free. If $$$ is a consideration, a transmatch
can be built with the help of an Ernie. The commercial models, like the
MFJ-949C are around $150 for transmatch, SWR meter, and dummy load.

Perry Scott
KF0CA

Ok Perry, I'll quit being so bashful and post this (some details may be
inaccurate - but generally it should be close):

A Zepp antenna is a single section of wire a quarter wave (1/2?) end fed with
open wire line. A douple Zepp is the same antenna with two sections of wire -
one on each side of the feed line.

The standard G5RV is a shortened douple Zepp fed with a magic length of open
wire line that (usually/sometimes) gives a usable match across most of the
hf ham bands. The standard G5RV is 102' long center fed with 30-33 feet of
open wire line followed by 50 ohm coax to the radio. It will match (with some
trimming of the feed line) on 80, 40 20, 15 and 10. The shortened size,
multiple bands and lack of a tuner make it really neat. By proper scaling
a half sized version will work from 40 meters down. If nobody else has the
exact dimensions handy I'll look them up and post them in a couple days.

Here's where I'm going to stick out my neck. The G5RV is a non-resonate
antenna. It matches in the ham bands (i.e. provides a 50 ohm load) but is
not resonate there. A true douple zepp antenna would be resonate (1/2 or a
full wave) for the frequence of use.

It's possible to use a douple zepp as a non-resonate antenna by putting up as
long of a wire as possible fed in the center with good quality open wire line.

The very-low-loss wire line is needed so the 1.zillion to 1 S.W.R. from the
ludicrous mismatch of impedance between the feedline and antenna (at
non-resonance) doesn't cause any significant signal loss. A high S.W.R. only
causes losses by increasing the loss in the feedline. Open wire line has such
low loss (compared to coax) it's effectively non-existant.

As a general rule the antenna length should be greater that 1/2 wave on the lowest band of interest. i.e. It should be over 130' for 80 meters up, over 66' for 40 meters and up, etc. At the higher frequencies (20, 15, 10) this antenna will start to show some gain. The longer the antenna - the greater the gain.

It can also be used at lower frequencies by tying the two ends of open wire line together and feeding it against ground as an end fed antenna.

The extended (very long) douple zepp is one of my favorite non-resonant antennas. I used to have one vee shaped, 40' at the top with 150' on each side. I fed this antenna with a real balanced line tuner (Johnson Matchbox). Cowabunga!

Also note that a Novice/Tech does have permission to operate cw on 15mtrs from 21.100 to 21.200. A really great band when it's open. Easy to work across the U.S. and DX, not crowded and only a short antenna is needed. I've actually operated on 15 with a 1/4 wave piece of wire (11') as a vertical plugged directly into the coax connector on the back of my transmitter and thumbtacked to the wall.

That's not recommended with uninsulated wire. And regardless of what the experts say - I wouldn't do that again with very much power - too much RF too close to the body.

And as for the original question about hidden antennas - I'd recommend a wire loop. There are two types: Use a balanced feedline (450 ohm good stuff or 300 ohm TV twinlead) with a tuner and make the loop as large as possible for a multiband antenna. Or cut the dimensions exactly for a single band and use a 1/4 wave matching section from 75 ohm coax. Most ARRL antenna literature has a 40 mtr full wave loop example that can be scaled to the band of interest.

Mount the antenna as high and as in the open as possible. I've had a 15mtr single band version made from a $1.49 pak of Radio Shack 22 gauge buss wire hanging from the upper to lower balcony at an apartment. It was nearly invisible and worked well. The third contact was Japan.

Another invisible antenna I've used was a loop of 150' of bell wire around the eaves of the house I'm currently living at fed with the plastic covered 450 ohm feedline run into a MFJ 949 tuner. It listened great. No contacts to report as I didn't staple it down very well and the winds blowing out of the Rockies disconnected the feedline and rearranged the antenna before I had a chance to use it.

Bill "Someday I'm going to really learn about antennas" Vodall
WA7NWP

p.s. Somebody ask Perry about the antenna he used to work Austrailia from a houseboat on Lake Powell, Utah.

> 10-80 meters e.g. a trapped dipole etc?.

Any antenna is better than no antenna. :-) If you can make the antenna
full size and you have the typical wooden decking and shingles roof, then
it should do fairly well. Unless your house is really long, you'll probably
have to forego 80 meters. A shortened, loaded dipole won't work great in
an attic. Try to keep the wire straight. You'll probably also suffer from
RF induced in your house wiring and will have to do some suppression to
prevent getting into all your appliances.

> 2. Anyone have any experiences (good/bad) with the AEA ISOLOOP

> still true?

Still true. If you're dealing with restrictive covenants here, you could
be treading on thin ice. If someone did complain, you would be out a
considerable sum to remove the crankup.

> 4. Any other good solutions out there?

A better solution is a disguise antenna. People have put up 66 foot metal
flagpoles and proudly flown Old Glory while secretly transmitting to the
the ends of the earth. I have never heard of a restrictive covenant that
prohibits displaying our national symbol.

Another disguise antenna is a traditional long wire strung high in your trees made of thin magnet wire. This stuff will handle the power level you will be running and is practically invisible from the ground.

I have been faithfully e-mailing the following to people who inquired about just where I got my information. Since it has generated more than a little interest/dispute, I will post the story here for everyone to read. If this is in error, I would appreciate someone setting the record straight:

I am the poster of the original note. Last year, I took a trip to New Zealand, and had the opportunity to take a small plane from Queenstown to Milford Sound. I spent some time chatting with the pilot and ATC people. (It was very informal at Milford Sound -- they get about a half-dozen planes a day there, and let me up in the tower.) Since I am a ham, I inquired about their radio gear. They use VHF FM and a lot of HF SSB over there. (New Zealand is mountainous in places, making VHF almost unuseable.) I was led to believe it is a standard not only for New Zealand, but for the Australian arena as well. When I mentioned we still used AM for ATC back in the States, they were dumbfounded -- holding the opinion it was an outmoded and inferior standard. They said New Zealand had converted to FM years ago.

For what it is worth, I suspect if we could reinvent the wheel at this point we would invent it with FM. However, I think that, given the constraints under which aircraft operate, that AM is not a problem. I would agree that it would hardly make sense to convert at this point, and if it ever comes about, it would have to be with dual frequencies and a phase in period, to the detriment of everyone's pocketbooks.

My two cents worth...

> with the 88 you'd care to pass along would be appreciated.

I have a PK-88, amongst other TNCs. It works as advertised. Seems to run a tad warm for my liking. If I was putting it on a hill that gets warm, I would put a better heatsink on it and punch some ventilation holes in it. I did that with my TNC-1 in Gucci box, it made both of us happier.

And where is lakeside? Knowing Californian geography, it probably isn't near a puddle let alone a lake.

Yours from where there are no woods and no holly grows here, although I once saw a couple of bushes in Studio City. But then Studio City having no cathedral isn't a city. And Cathedral City outside Palm Springs has neither a cathedral or a city, just a bunch of waterbed shops and gas stations. But I digress.

See below for connector cleaning tips.

> This is good advice with any "modular construction" equipment since
> manufacturers tend to cut corners here and not use gold flashed contacts.
> The solder coated connectors used in most equipment reacts badly to
> the sulfur dioxide generated by the catalytic converters on newer cars.

The coating on cheapo connectors is tin, not really solder. Tin
contacts work fine if they get excercised and kept away from moisture
and such. But if you can avoid them do so. They always get noisy. I
prefer silver. Although silver tarnishes (yes sulphur again - never
eat boiled eggs with a silver spoon, it annoys the butler), the
tarnish is conductive. Tin oxides and sulphides are not conductive and
gold stays shiny no matter what and it will never make your fiancees
finger green.

> That "rotten egg" smell you often notice from newer cars is the precursor
> of sulfuric acid which will react with the lead in the solder and turn
> it a black lead sulphate rather quickly in urban areas.
The the rotten egg gas is hydrogen sulphide which is now considered
toxic and when I was a schoolboy was considered to be great stuff that
also gave adults headaches. Most tarnishing in urban areas is caused
by sulphur dioxide. This is a by product of coal and oil combustion. It
is also found in wine so try not to spill the Ripple into the
electronics.

For those of us lumbered with budget tin and even zinc connectors, I
suggest some prophelatic treatment with Cramolin Blue and Red. The
blue cleans off the crud and the red protects. But you can also clean
off with denatured alchohol and coat with Electrolube.

All the current NASA-bashing is really getting to me...

Someone locally predicted that everyone would completely forget that the current series of launch scrubbings would be for safety reasons, and would instead focus on the fact that we'd scrubbed. From Jim Grubs' comments here, as well as others I've heard just about everywhere I listen, they're completely right.

_I_ am getting tired of the double standard here: first NASA is shot at for trying to launch too quickly, and cutting corners on safety in the aftermath of the Challenger accident, and then they're shot at for taking precautions for safety reasons and delaying flights. You can't have it both ways!

Well, you could say that. I think he meant that he's embarrassed by the fact
that we can't get a rocket in the air because of techincal problems, not because
it looks wimpy to cancel a launch.

>(or 3.5795..) crystal for contacts.

But, that's one of my favorite tricks -- after W1AW is done, the
frequency is "clear" for a few moments, and lots of people haven't
finished reaching for the knob yet..._somebody_ will call CQ, and
if they don't, I sometimes do, and I've made a lot of WAS contacts
that way by calling CQ to a particular state.

See you in London!

>Oh ya, the question...is the 88 worth the money? Any experiences with the 88
>you'd care to pass along would be appreciated.

The PK88 is ok. Most TNCs are ok. We've used a lot of MFJ1270s in our network and have found out the little tricks to make them rock reliable at unattended sites. Currently we are installing only Pac-Comm Micropower Tiny 2 TNCs. They are very low power, have high integration, are cheap, and our reliability track record with them has been extremely good.

You may find that interfacing the Icom HT right is a little tricky. Implementing PTT properly on this series requires a careful choice of pulldown resistor and coupling capacitor to get both good frequency response and good PTT key up delay. The radio tends to key very slowly if you use too large a time constant and tends to have lousy audio if you use too short of a time constant. Start with a .1 mfd cap and a resistor in the 2-3 kohm range and adjust for best results.

I wouldn't bash Radio Moscow to badly if I were you. Our own house isn't exactly clean.
When I lisved in Newburgh, NY, I used to be able to tell when the finals of a radio station in NE PA were going soft. Their 3rd harmonic at 4020 came in clear as a bell and interfered with various MARS operations along the east coast. You can only pick up the fundamental about 30 miles from the station so I would say that a 3rd harmonic that strong 250 miles (and more) is somewhat of a problem. Complaints were filed both with the FCC and with the applicable Military agencies. No action was ever taken to my knowledge.

Jay, the real problem is that NASA sold the shuttle system to congress
and the public as a reliable, cheap launching system. Pressure to meet
that promise caused the Challenger accident. They still can't admit
that the shuttle program has been an unmitigated disaster.

It has greatly reduced america's space launch capability. It has led
to such potential disasters as a several year window when we could not
launch any KH series spy satellites, when only one KH-11 was functional.
We currently have only one working geosynchronous meteorological satellite,
when we are supposed to have two active and one in-orbit space. Now we
find that the replacement (which was supposed to be launched years ago)
has defective mirrors and would not work. Then there's the Hubble
telescope.

Yes - NASA has a lot to answer for. As with any government bureaucracy,
NASA has become barnacle encrusted, and has replaced engineering decisions
with political decisions.

On the other hand, I have great respect for the technical people in NASA.
Many of these people are incredibly well educated, very bright and
yet accepting relatively low government pay because of their devotion
to the space program.

1365. Abreviations for Units (Questions)

Newsgroup: rec.ham-radio
Date: 1990-09-21 17:44:19 UTC
From: rc@cmr.LOCAL
Message-ID: <9009211744.AA01345@cmr.ncsl.nist.gov>
Source record: 8243

I earnestly seek comments on abreviations for some units we all commonly
see:

Quantity Unit Abrev. Remarks
---

storage capacity binary character bit This doesn't look like an
abreviation to me, but "b"
is already used for "bar" or
"barn". What else would you
suggest?

storage capacity byte (eight binary by or would you rather have
characters) "octet" and "o"?

modulation rate baud Bd named for Baudot

digit rate digit per second ? bit/s suggested, however what
do you all think about naming
it for Claude Shannon? Thus
the unit would be the "shannon";
the abreviation would be "Sh".

Remember that these units and abreviations have to work in a lot of languages.

Tnx, 73 Bob W3OTC <rc@cmr-ncsl.nist.gov>

1366. QSL info

Newsgroup: rec.ham-radio
Date: 1990-09-21 17:45:54 UTC
From: oo7@ut-emx.uucp
Message-ID: <37446@ut-emx.uucp>
Source record: 8245

beams@norvax.UUCP (David Beams) asks about QSL information:

--The mailing address for 7X3DA was reported in an earlier issue of the W6GO QSL Managers List (issue 125, I think). Does anyone have access to this list who could e-mail me the address?

The address in the W6GO/K6HHD Managers' List is:
A. Djoudi, Box 1033 LM, Laghouat 03000, Algeria.

The address on his QSL card is:
Abdelhamid Djoudi,
Avenue des Freres Menouar,
Lotissement Bouameur,
03000 Laghouat (Algeria).

--I recently worked UM8MBA who requested that QSLs be sent direct. My '89 Callbook has no address for him; does his address appear in the '90 edition?

I also have a card from him, it came via the bureau (not in response to mine, although I sent one that way). The only address on the card is your friend and mine, Box 88 Moscow. His address in the '90 CB is:

Ivan Udovin, Box 745, 720017 Frunze.

I have also found W3HNK very helpful in getting some USSR cards. Send him your card, an SASE (25c stamp) and $1, and he can often get the card for you. Some come quickly, some come slowly, some never come, but that is not his fault. The Managers' List sepcifically mentions that W3HNK can get "any UM8 card".

--And, on the subject of QSLs sent direct to the USSR: what does one include for return postage? Does the USSR now exchange IRCs? Or is it customary not to provide return postage for a direct QSL into the USSR? I have never sent a direct QSL to the USSR; I always used Box 88.

If you send anything direct to Box 88, make it just a card (no IRCs, no filthee Yankee money - that can cause trouble for the cardee). I have sent IRCs to the USSR many times and they are clearly acceptable, since I nearly always get a card in response. I suspect that the IRCs are used to send to other (non-USSR) hams so that the USSR guys themselves can collect DX cards. I have had USSR hams tell me that they received my card without the IRCs originally enclosed; in cases like this they always send me a card anyway, and I always send them a couple more IRCs. They then sometimes write to tell me that the second lot reached them OK! However, I don't think they can obtain IRCs by going along to the local post office, so they are probably not directly cashable there. One thing

you could try is to offer to get a card or two from a US manager for the USSR guy if he is a DXer.

--This question may appear rather juvenile to the more-avid DX enthusiasts of the net community, but I am an occasional DX'er and my most formative DX experiences came in the years when Box 88 was the *only* way to get a QSL into the USSR.

Seems a perfectly sensible question to me. The net has some Big Time DXers on it, some novice DXers and lots of people in between. I regard answering some of these queries as serving the Public Service aspect of my license :-)

"bit" sounds good. And it *is,* afterall, already a contraction from
"binary digit." An early mention of this appears in Shannon's 1948 paper.

>digit rate digit per second ? bit/s suggested, however what

Hi,
I mentioned in my comparison of the R1 and AR1000 that there were a couple
os short cuts for programming it. One thing to note, my unit came with
newer documentation than my friend's, and covered some things not in his doc. I can't
remember the differences, but below are some hints not covered in any of the docs.

To program in a frequency to a scan channel, get to the channel of
choice, type in the frequency, hit enter, then select
AM or FM. Hit the AM/FM or WFM even if you didnUt need too
For some reason, the frequency is now programmed in. Then to go up in
sequential order I just hit the manual button which advances up to the
next channel. Note that if you don't
hit the FM/AM or WFM key you can listen to that channel with-out adding it
to the scan memory. You can also manually search up or down from there. The
problem is if your not in the right recieve mode (AM/FM/WFM) and you change modes then that
freq. is stored. I always leave channel 000 as a scratchpad location to do manual searching
and direct frequency entering... I find this a plus feature.

There is no way (that I know of) to simply review the limits set
on search banks. One hack is to enter the search, which always starts
at the beginning and then search down (manually), this wraps around to the
upper limit.

Remember to make use of the freq. lockouts in the search mode. For example
I use only one search bank to search a range of freqs. that has some annoying signaling
channels in the middle of the range. The other, less optimum solution, is to use two search
banks and link them together.

Glen

The SB220 is a nice amplifier. Mine still works great, and I built it from a kit over ten years ago. It is rugged, and I even use it on RTTY with 500 watts out.

You might check out the mod that involves replacing the diode string in the power supply with higher rated diodes, and equalizing resistor/cap in parallel with each one. I also operate mine without the green cover (there is still internal shielding) and I have several surplus muffin fans sitting on top to provide additional cooling for RTTY operations.

It is a nice rugged amp, although there are other amps like the Henry 2K that use 3500Zs and have a beefier power supply. I sure would prefer it to Heath's new version that has just one tube.

True, but this assumes that there will still be a government still in control of the situation. After a massive nuclear attack, there may not be a government left worth mentioning. A state of chaos would exist on both sides of the conflict; neither side would be able to mount a followup assault. Thus, the war would be effectively over.

I have been off the air for many years and have been
thinking about getting on again. Back in the 1960's(when
I last operated) there were weekly sessions of high-
speed code practice(usually 40-65 wpm) sent out by
several stations with proficiency qualifiers every
month or so. Are there any stations(other than the
usual practice from W1AW) which still send high
speed code practice?

>for this engine.

Uh, Bob, what's an RTX-2000? I see the phrase "DSP" in your
keywords, so maybe it's a DSP microprocessor? If so, what will
it do on the satellites?

>The RTX-2000 wil fly soon on RS-14 (RO-21 after launch)

This is the first time I've seen a Soviet ham satellite called
anything other than "RS" when it's in orbit. Why will this one be
called "RO"? What does that stand for? And why "RO-21" when the
current transponders are RS-10/11? (I guess RS-12/13 is still waiting
in the wings?)

Speaking of mysterious carrier signals, how about the one at 28.626?
It is the 8th harmonic of the TV colorburst frequency. Those TV sets
that surround us are quite strong even at the 8th harmonic.

> Let'em blast it. The X-rays won't hurt it.

Well even if it would cause crystal defects, the innards are inside a metal case, right? At least in the case of my FT411. Of course the X rays might bother the LCD, or perhaps a strong magnetic field would injure something... ?

> ...embarressing if you don't know any of the local repeater freqs.

Just do a memory scan?

> I would like to get a license to use a ham radio. What do I have to do?

Study and take the test at the next local hamfest or periodic exam date,
usually sponsored by a local repeater club.

> Do I have to know Morse code or has that changed?

Yeah, unfortunately, 5WPM. Pick up a copy of "Tune in the World with
Ham Radio" (did I get the title right this time? :-) and the tapes that
go with it, from a local radio/electronics store, or order through a
bookstore. It will give you what you need. Good luck, have fun.

1381. On being a ham (was homebrew,magmounts,etc)

Newsgroup: rec.ham-radio
Date: 1990-09-22 00:02:00 UTC
From: BA01@SWTEXAS.BITNET
Message-ID: <9009220002.AA00220@ucsd.edu>
Source record: 8376

Hello. I have been a ham since the fall of '88 and received my Technician ticket last October. I've gained some interesting info and have refrained from jumping in the fray on the numerous long-winded debates on this list. However, there are some opinions I would like to voice.

It's extremely unfortunate to read the large number of messages from hams who apparently have not only decided what the hobby means to them but have decided that it should mean the same thing to all others. For example, you're only a "real" ham if you punch a hole in your roof to mount your antenna and build/repair/modify your equipment.

This sounds extremely elitist. Hey, I know these folks don't know me and it's probably not personal. However, it is insensitive and it doesn't do anything for the hobby...especially on a list like this which is subscribed to by many different people.

What I got into ham radio for was the communication and the friendly atmosphere -- not something you can (or are meant to) find on any other communications service. I wasn't interested in the technical aspect at the time other than to operate my equipment safely and competently.
And if I had been given an attitude by hams around me that I could only be a part of amateur radio by being a "techie" I probably wouldn't have bothered. That's why I got into it. Others probably have different reasons. I don't expect anyone else to espouse mine.

That's the nice thing about hobbies: you can get what you want out of it and participate to whatever degree jazzes you.

Thanks for your attention.

Sorry to post this to the net, but I can't get there from here.

For GARY, KE4ZV:

Could you post or E-mail me information about the mods you did to MFJ-1270 TNCs? I have had some problems with my 1274 (same thing with LED display) that your mods may fix or improve on.

Thanks and 73,

Michael

The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. As a service to the satellite user community, the most current of these elements are uploaded weekly to sci.space. This week's elements are provided below. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

BUZZZ Sorry, but thank you for playing. :-)

You must have an "official" station location within the jurisdiction
of the FCC. You don't actually have to have a station there, but you
must have an X drawn in the dirt that you can call your own somewhere
in the states, territories or protectorates.

>>Bernie, N5PQY

Bernie - don't take it too seriously. Reading this net is a bit like tuning
across the ham bands. There's a lot of funny noises, and different convers-
ations going on about all sorts of aspects of the hobby. Do what you do on
the bands, tune past anything that isn't to your liking, but listen to the
stuff that interests you and join in if you feel like it. I've met some
really nice people through the net, we correspond (mainly about DXing) on
an almost daily basis. Just as the loudest signals on the air are not
necessarily the people you want to work, you can ignore anything you want
to on the net - works for me! This is a pretty friendly and helpful net
on the whole, it's just a bunch of real people airing their views, which
don't always interest all possible recipients. But don't take anything
personally, it's rarely meant that way by anyone on this net!

1386. 2m to Mexico?

Newsgroup: rec.ham-radio
Date: 1990-09-22 03:14:53 UTC
From: rah@public.BTR.COM
Message-ID: <445@public.BTR.COM>
Source record: 8231

I suppose it is the "curse of the net" to have newcomers post the same questions over and over... but, since I can't seem to find a coherent answer elsewhere, here goes.

While I'm waiting for the FCC to process my paperwork (!), I'm shopping for a 2m handheld (which one to buy is another one of those questions.. but later, perhaps). My family and I will be traveling to Baja for the '91 eclipse and I'd like to use the rig while down there. Locating any holes in potential cloudcover would be the primary use, but its emergency potential would be a comfort too. I ramble.. so, what problems am I likely to encounter with the Mexican authorities? Will I need some sort of permit? Do I have to retake the code test in Spanish? :-)?

Thanks in advance!

I realize that I may get flamed by the "real" programmers (the "Extra Class" of softwaredom), but here goes. BASIC isn't a "toy" language for the average joe who wants to do something with his computer without getting a CS degree. Because it is plain english (sort of), I can whomp out an occasional program that fits my needs. For my more advanced needs, I can look to the professionals. Looking down one's nose at BASIC users is tantamount to looking down one's nose at Novices.
Nomex suit on.

>of the Challenger accident, and then they're shot at for taking precautions
>for safety reasons and delaying flights. You can't have it both ways!

Sure you can Jay. Shoddy workmanship and poor design lost Challenger after NASA cut safety corners due to launch pressure. Shoddy workmanship and poor design have caused numerious launch scrubs after NASA started paying attention to safety again. The problem is still shoddy workmanship and poor design either way.

There is plenty of blame to go around. Congress is at fault for an erratic budget process that played hell with the design of the shuttle. The current shuttle is certainly not the shuttle NASA wanted to build. The contractors are certainly at fault for letting bottom line pressure cause shortcuts in the design and manufacturing process. And don't forget that Rockwell contract employees, not NASA employees, prep the shuttle for launch since budget cutters decided to privatize launch services to the lowest bidder.
NASA is at fault for continuing to beat a dead horse.

The shuttle was originally sold as a way to reduce the OPERATIONAL costs of launching things into space. Unfortunately, political decisions were made in Congress to cut the design and procurement costs instead. This resulted in a vehicle that is not cheap to OPERATE nor safe to OPERATE nor reliable to OPERATE.

Bandaids aren't going to solve this problem. It's time for NASA to claim that the EXPERIMENTAL shuttle has been a sucess in teaching us what not to do and now it's time to start over with a clean sheet of paper to design a real, workable, operational shuttle.

>

Better than that....feed the center of the 70 foot dipole with open wire line or twinlead (the 450 ohm transmitting type ladder line is neat) and tune it with an antenna tuner that has a balanced output. You then have the classic center-fed Zepp antenna.

70 feet is not really half of a G5RV, as the G5RV is 102 feet long. The G5RV is really a special case of the center-fed Zepp, with convenient length and matching sections so that it will operate on all bands. Feeding it with twinlead and a tuner is a lot less lossy and a lot less tricky to set up.

The classic length for the center-fed 80-10 mtr Zepp is 120 feet, but you can make it any convenient length. It probably works best if the length at least approaches 1/2 wavelength on the lowest frequency. The open wire type feed has such low loss that almost any mismatch at the feedpoint can be matched with a balanced tuner in the shack, with little loss of efficiency. This trick does not work with coax.

Oh, and one more thing....Novices can use 15 CW, and upgrading to Tech makes no difference.....Novice and Tech allocations on HF are the same.

> is good enough. I think there is enough room also for a simplex freq also.
>
> I have no problems with 438-442, if it is used appropriately. I still think
> split freq is better.

What is a good alternative? The "usual" bandwidth is 6 Mhz when the
suggested vestigial sideband is used. You could trim things even tighter,
but no one makes anything to do that yet, and the best you could hope for
would be about 4.8 MHz. Suggest a place to fit that in.

> AEA is one of the culprits. From what I understand, the AEA unit will
> not work on a non-interefence basis below 442. (IE, it's output will
> still be in the FM band.) This is from a discussion with several hardcore
> ATV'ers at Dayton.

No, AEA is NOT the culprit, but rather the culprit is the bandplan which
puts the carrier at 439.25 MHz and that will generate signals all the way
up to nearly 444 MHz even if the filtering is working correctly.

> I asked how I could run an ATV rptr in my area, while coexisting with 443+
> fm rptrs. They named one unit that would work. It was not AEA. They liked
> AEA package & price, but indicated it did not filter as well as it should.
> This is their viewpoint. I would be interested in knowing more, as the AEA
> will prob be the most popular.

The AEA unit may or may not be filtering well, but even with a theoretically
perfect filter, you will be affecting more than half of one side of the FM
repeater subband.

> Actually, the ATV rptr output is usually the higher freq, due to not
> having the FM rptrs key it up. The ATV rptr will be the one needing the
> extra filtering. Is this correct?

Probably.

> >If I do a repeater it would be on the higher bands. But I would be using

> >are for DX-ers" :-)
>
> Ok by me... ATV simplex seems like weak signal to me.. I do think we need
> to use the 420-440 area more.

Not everyone can use that. Remember that 420-430 is not available in all parts of the country. Try fitting just ONE ATV channel in 430-450 MHz that can be used for repeater operation. You do NOT want to put it on 432 MHz and you cannot put it on 435-438 MHz.

The 70cm band is currently very poorly fragmented.

This issue, while being certainly packet related since packet needs to definitely deal with coordination problems, should be moved over to the main rec.ham-radio group.

One nuke will not cause a nuclear winter. Many have been explode above ground since the 1940's and there is no nuclear winter. The problem that could cause that is a massive release of enormous numbers of the larger ones that exist now.

One nuke WILL cause a WAR. That will result it shutting down of ham radio and resultant military conflict. That conflict might be massive nuclear and could result in nuclear winter and shutting down of government. What will result, if anyone is left, is PIRATE radio.

The original question about the effect of nuclear winter on propogation is fine and applicable in such a context.

We can speculate on what will happen, but I don't think we will know what actually will happen unless we get this scenario to try things out on.

This ham radio discussion group is as widespread as it is just because we are addressing (nearly) the lowest common denominator. If someone wants to address only those running a higher level of software perfection, then I suggest you create your own network and let us know how well it does.

What might be to you as excellent quality software might not even work on some other platform, and might be very unfriendly in other regards such as customizing the user interface.

The solution to this problem is quite a simple one:

If you have public domain or freeware software to distribute:

1. Announce about it on the appropriate topical group, describing what it does and where it can be obtained. Keep its size to the limit used by other items on the newsgroup.

2. Make it available by as many of the following means as you can:

a. Post it on the appropriate software distribution newsgroup. If your site does not have access to these groups, maybe you can contact someone who can post it for you.

b. Make it available for FTP access. If you have FTP client access only, FTP it to vmd.cso.uiuc.edu (cd phil.512) and leave it there. Everyone has write/delete privileges. If you have no FTP access, maybe you can E-mail to someone who does.

c. Make it available on an E-mail based fileserver if you have access to one.

d. Offer to email to anyone requesting it if you have the time and resources to do this. Urge that requests be E-mailed rather than posted.

e. If you are willing, offer to smail-mail the software on the appropriate media, in exchange for cost of time and materials.

f. Submit copies to distributors of public domain software (with a signed release stating you are releasing it to the public domain).

g. Send copies to applicable magazines. They might write a review of it.

DO NOT post the actual software to a talk newsgroup unless it is very short (under 72 lines might be a good limit).

That, too.

> I don't think I ever claimed that high-tech people are ATTRACTED to ham
> radio by the 13- 20-wpm CW requirement, but I do think that I demonstrated
> that amateur radio technical leaders usually are proficient in CW.
> Are you unwilling to concede this?

What you phrased may be correct, but this is how statistics is manipulated.

You state "...amateur radio technical leaders..." which implies those who
are ALREADY involved in amateur radio. Whether or not I concede, and
whether or not your statistics are correct, does not even matter since the
issue is NOT how to get currently licensed hams to gain a code proficiency.

The issue is how to get people who are NOT now licensed hams into being
licensed hams and eventually becoming "amateur radio technical leaders"
(among other things).

It is asserted by us no-coders that there is a group of people out there
who would become hams if the code restriction were lifted, such as by
having a new license class w/o a code requirement. While this assertion
has not been proven, it is not disproven either, and methods of studying it
statistically would be too expensive anyway (one would have to survey a
significant portion of the whole population).

Clearly, if the above assertion is correct, and if such a licensing system
is enacted, and if lots of these people become "amateur radio technical
leaders", then the statistics regarding the level of code proficiency will
change. There will be more of them who don't know code at all.

So the CORRECT way (we believe) to phrase the statistical question would be
more like:
What is the potential CW proficiency of the combined population
of current "amateur radio technical leaders" and potential "amateur
radio technical leaders"? And does it matter?

The CW test acts as a filter. Your statistics studied the characteristics
of those who pass the filter and ignore those who are rejected by the filter.
Additionally it ignores those who avoid the filter for whatever reasons
such as being confused about what ham radio really is since it still

requires a Morse Code test (seen as antiquated by many) or standing on
principle of just not attempting to do something that has no bearing or
relationship to what they might do as "amateur radio technical leaders".

While the points about why people don't or can't become hams are arguable,
it remains a fact that there are people who are not hams for reasons they
believe to be applicable and appropriate.

The statistics that would make more sense in determining what to do would
be ones that study the people who will become hams under proposed changes,
and those who won't or can't under proposals to stop or limit such changes.

Many of the current "amateur radio technical leaders" are proficient in CW
and this I will concede. But I do not concede that such a fact is important
to the issue since I believe it to be irrelevant.

> I had expected that Technicians would show up in much greater numbers.
> If I had found that any substantial number of the technical leaders were
> Techs or Novices, I would agree that CW is so offensive to techies that they
> just learn the barest minimum CW and it is a serious hurdle. Do you suppose
> that the distribution is bimodal - most high-tech hams find CW no big deal,
> but most high-tech non-hams are kept out of ham radio by the code?

One of the things that it shows is that once one does overcome the hurdle
of CW, that it shows that those who are "amateur radio technical leaders"
tend to find that HIGHER SPEEDS are not a hurdle.

But still, your statistics DO NOT address those who have not overcome the
hurdle nor those who refuse to "jump through the hoops". And it is THESE
people we are trying to address in no-code proposals.

If the issue was one of lowering the CW requirement for EXTRA down to just
5 WPM, then your statistics would be good evidence that such a thing should
not be done because it shows that those who already pass 5 WPM can, in at
least some numbers, go on up to 20 WPM. I believe that I can do it, though
I have not done it.

In any event, those interested in doing their technical leadership on the
VHF/UHF/SHF/EHF bands, where most technical pioneering is taking place,
are not benefitted at all by the privileges of the Extra class license.

> The British have issued no-code licences since 1964. Has their

> technical articles:
> Class A (code) 18
> Class B (no-code) 1 (~ half of all G's are Class B)
> Unsigned Q&A Article 1
> Also, the Brits are so concerned about the aging of
> THEIR ham population that they have announced Novice licencing.
> I'm not convinced that the British no-code licence has brought in either:
> 1) lots of young people, 2) lots of high-tech people.

A no-code license ALONE certainly will NOT make any such achievements, either in Great Britain, or in the United States. It **MUST** be combined with the appropriate promotion of amateur radio to those who would be such technical people, as well as the general acceptance if such licensees on the part of all other hams.

In my efforts to recruit people to ham radio, the greatest stumbling block is in justifing the code test (which I cannot do) to someone who is convinced that they are not going to use code. I've already posted my scenario of how I try to do this, where I explained how I learned and forgot code, and found the potential ham arguing the merits of trying to learn something you expect to forget. I cannot justify it.

The people I have tried or considered recruiting are not all the technical types, but are people who would make some contribution. They won't be developing digital signal processing technologies to make HT moon-bounce possible. They might put up a digipeater in a useful location. They won't be writing articles in a technical ham radio journal. They will, instead, be helping us conduct local emergency radio communications.

Tell me you DON'T want these people.

How do you know ham radio would be shut down? It was during WWII. Since
then the US has been in several situations that weren't "official", but
sure seemed like wars (ie Viet Nam, Korea) without pulling priveledges.

If there is a nuclear war, I don't think cancelling ham radio will
be a high priority action item in the 2 hour war scenario.

Precisely my point. It is not the question of whether NASA is too quick or too slow at scrubbing for safety reasons, it's the fundamental management flaw in start to finish quality control.

I think it is too easy to blame Congress. They didn't knowingly do a poor job. They did the best they could with the sense they were able to make of the deliberate snow job NASA did on them.

Why shouldn't we bash NASA? They deserve it. This is no time for sweeping things undeer the rug.

I thought you had to be a Citizen or Permanent Resident Alien, which leaves
out tourists, students, etc., who presumably have to go the reciprocal
agrement route????

Message-ID: <26fc6203-69arec.ham-radio@vpnet.chi.il.us>
Source record: 8259

Is it legal for a packet radio station to run 'online games'? If so, has anyone prepared any games for use with packet radio?

The ability to have up to 16 connections to the same machine at one time makes for some interesting possibilities...

I'm reasonably close to finally getting a ham license, and the answer to these questions will partly determine whether I start off with HF or VHF.

Does anyone get a little nervous at the thought of packet games filling the frequencies???

SAREX/STS-35 MISSION DELAYED

HR AMSAT NEWS SERVICE BULLETIN 265.01 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 22, 1990
TO ALL RADIO AMATEURS BT

STS-35/SAREX Mission Delayed; Rescheduled Launch Date Planned For Dec. 1, 1990

NASA officials were forced to scrub the launch of STS-35 on Sept. 11, 1990 due to the recurrence of a hydrogen leak in the aft engine compartment. Because this leak appeared to be much worse than leaks previously encountered, NASA officials will again roll the Shuttle Columbia back to the "hanger" to perform needed repairs. During the time that the repairs are being performed on Columbia, the Shuttle Discovery will be made ready for lift-off. Discovery carries a "time-critical" payload, known as Ulysses, which must be launched within a thirteen day period beginning Oct. 5, 1990. After the Ulysses mission comes a classified DoD launch on the Shuttle Atlantis. This mission is planned for November 10, 1990. NASA planners are working on a December 1, 1990 launch for STS-35/SAREX. Although four launch attempts would try the patience of even the most stalwart SAREX enthusiast, it is evident that NASA remains committed to completing the STS-35 mission goals. AMSAT would like to thank the many dedicated volunteers who have worked so hard to make the Shuttle Amateur Radio Experiment a reality. As the launch of STS-35 approaches again, AMSAT and the ARRL will start to again publish the necessary information for the SAREX mission. Watch for bulletins from the AMSAT News Service (ANS) and W1AW bulletins in mid-November for updates on the progress of the STS-35/SAREX mission.

FO-20 UPDATE/SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 265.02 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 22, 1990
TO ALL RADIO AMATEURS BT

Latest Japanese Bird Still Experiencing Temperature Problems

The FO-20 Command Team at JARL report that FO-20 is continuing to experience high temperature problems which is forcing a drastic reduction of operations on the Bird. Unfortunately, because FO-20 is currently experiencing a period of eclipse-free orbits, the natural cooling off of the satellite during eclipse is not occurring. Therefore, the reduction of transponder operation availability is one way to reduce the internal temperature build up.

Although subject to change at any moment, this list is the current schedule
of operation for FO-20:

From To Mode
+-
25 Sep 90 0700 26 Sep 90 0910 JD, on demand
27 Sep 90 0740 28 Sep 90 0950 Continuous JD
01 Oct 90 0900 02 Oct 90 0910 PSK Telemetry acquisition
04 Oct 90 0955 04 Oct 90 2330 JA
08 Oct 90 0920 08 Oct 90 1110 JA and JD
11 Oct 90 0825 12 Oct 90 0850 JD

The above dates and time are in UTC.

The FO-20 Command Team will be monitoring satellite performance and operations
during these times and may turn off the transponder if they determine that the
satellite is in danger.

[ANS thanks the FO-20 Command Team for the information in this bulletin]

AMSAT SYMPOSIUM TALKS, PT 1

HR AMSAT NEWS SERVICE BULLETIN 265.03 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 22, 1990
TO ALL RADIO AMATEURS BT

Wide Variety of Topics to be Presented at AMSAT Symposium

This year's AMSAT Symposium will be held during the weekend of October 19, 20,
and 21 at the Johnson Space Center (JSC) Visitors Center. Presentations will
be held in the Visitor's Center Auditorium, and have been scheduled for all
three days of the weekend. The talks have been scheduled in serial alignment
so that you will not have to choose between two talks at any given time.

Friday's talks, which begin at 3:00 PM include: Satellite Image Processing for
the Amateur, AMSAT-NA Education Activities and finishing with AMSAT Orbital
Data Management. Saturday's activities begin at 8:00 AM. A scan of the
program lists talks on such topics as:

The Decoding Telemetry from the Amateur Satellites
In-Orbit Performance of 4 Microsat Spacecraft
A discussion of AO-13's Orbit
A report on the Phase 3D Project
Phase 4 Technology as it Applies to Phase 3D
Macromets and Microsats
A Pacsat Demonstration
Microsat Motion, Stabilization, and Telemetry
Full Motion Digital Video Via Amateur Satellites
SAREX Hardware for STS-35 and 37
Astronaut Deployable Satellites
Webersat Operations and Experiment Results
AMSAT-NA Operations Organization

The Development of 2 DSP Modems

HR AMSAT NEWS SERVICE BULLETIN 265.04 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 22, 1990
TO ALL RADIO AMATEURS BT

Saturday evening's activities will be held at the JSC Employee's Recreation Center and with the ever-popular Attitude Adjustment Hour which is followed by a Texas Bar-B-Que Dinner. AMSAT is very fortunate to have as its Guest Speaker Mr. Aaron Cohen, Director, Johnson Space Center. Following Mr. Cohen's address the AMSAT-NA Annual Meeting will be held.

Sunday's activities begin at 9:00 AM and the topics to be presented will be: Getting Started in Amateur Satellites, Building a Versatile Homebrew Satellite Ground Station and Poor Boy Satellite Station. For those who can delay their departure time until late Sunday, there will be a chance to attend an open house (starting at 1:00 p.m.) at the world's largest amateur antenna, W5UN, the station that brought DO-17 (Dove) back to life.

When making airline reservations, please note that Hobby Airport is MUCH closer to JSC than Houston Intercontinental Airport. Contact AMSAT Headquarters at 301-589-6062 for further information on Symposium registration and accommodations.

SAT ACTIVITY FROM ZIMBABWE

HR AMSAT NEWS SERVICE BULLETIN 265.05 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 22, 1990
TO ALL RADIO AMATEURS BT

Final weekend for Four Special Callsign Stations

You have only one more weekend to pick up on four special prefix callsigns sponsored by OSCAR enthusiasts from Zimbabwe. Z21HJ/R and Z21GH along with the active support of the Zimbabwe Amateur Radio Society have been sponsoring four separate satellite stations operating from four different locations around Zimbabwe. These stations have been issued the call-signs: Z21SAT, Z22SAT, Z23SAT and Z24SAT (pre-fix hunters should find some interest in these calls). The stations have been found on Mode B around the frequency of 145.905 MHz.

Special QSL cards will be available for each of the four stations. ANS has been informed that QSLs will be sent either via the bureau or, if a speedier reply is desired, the standard DX-QSL protocol of including an IRC will hasten the card reciprocation.

In addition to the special QSL cards, those stations who have worked at least two of the four call signs will qualify for the "ZIMBABWE SATELLITE

ACHIEVEMENT AWARD 1990". This beautiful award is based on African culture and shows the famous Victoria Falls in the background. The award will be available for a nominal donation. Further information on QSLing and the award should be available from the stations during the operation.

OPERATIONS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 258.06 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 22, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule Announced

AMSAT Operations Nets are planned for the following times. Mode B nets are conducted on an AO-13 downlink frequency of 145.950. Mode J/L nets are conducted on an AO-13 downlink frequency of 435.970.

Date Phs mode UTC NCS Alt. U.S. day

28 Sep 90 171 J/L 0100 KA5SMA N5BF Thursday
9 Oct 90 172 J/L 0015 WD0E WB9ANQ Monday

- 15 October 90 reorientation to 180/0 -

21 Oct 90 98 J/L 1800 WB6LLO W5RRR* Sunday
27 Oct 90 135 B 1300 WB9ANQ KA5SMA Saturday

* Most NCS operators will be at the AMSAT Symposium at JSC in Houston, TX on 21 October 90. As a result, this net may be cancelled.

Nets are scheduled for North American geographic coverage and time zones although other parts of the world are often within the footprint and checkins from everywhere are welcome. Those who don't have adequate and convenient coverage from this net are encouraged to schedule their own nets via AO-13.

Write to AMSAT Headquarters with your schedule and we will run it in ANS.

For information on the amateur satellite program and how you can participate, contact AMSAT-NA Headquarters at P.O. Box 27, Washington, DC 20044, phone (301) 589-6062, or contact your local AMSAT Area Coordinator.

SB ALL @ AMSAT $ANS-265.07
AO-13/AO-10 TRANSPONDER SKED

HR AMSAT NEWS SERVICE BULLETIN 265.07 FROM AMSAT HQ
SILVER SPRING, MD SEPTEMBER 22, 1990
TO ALL RADIO AMATEURS BT

A new Transponder Schedule for AO-13 was put into effect on September 8 which is planned to continue through October 17.

Mode S operation has been eliminated for the time being since relatively poor solar panel illumination does not allow sufficient power for proper battery maintenance during Mode S and S/B periods. Satellite reorientation (a.k.a. magnetorquing) is scheduled to commence on October 15 and once it has been completed, it is expected that Mode S will be returned to service.

The present transponder schedule for AO-13 is as follows:

Mode-B : MA 003 to MA 165
Mode-JL : MA 165 to MA 195
Mode-B : MA 195 to MA 240
Off : MA 240 to MA 003 (Mode B Beacon On)
Omni Antennas : MA 240 to MA 060

The September 10 attitude estimate is:

BLON = 205 and BLAT = -7

AMSAT-OSCAR-10 appears NOT TO have been receiving sufficient solar panel illumination to support Mode-B transponder operations. Both beacon and transponder signals show signs of FMing. Until further notice please DO NOT use AO-10's transponder.

It is expected that AO-10 may once again receive sufficient solar illumination to support Mode-B transponder operation by sometime in November.

Nope. The original poster was correct. You don't have to be a citizen.
You don't have to be a permanent resident. You can be a tourist or a
student. The only restriction is you can't be a representative of
another government. (We shouldn't be concerned about tourists, but
maybe a restriction against terrorists would be good! :-)

Which works even better if you use two or more wires on each side of center spread a foot or more apart at the ends. It then approximates a biconical dipole, which doesn't have the extreme feedpoint impedance variations of the single, thin conductor version. That makes the job of the tuner at the radio end of the ladd line much easier.

I have a friend who tried 4 wire ladder line. Works even better than the 2 wire kind. The line radiation losses are much less than all but the most expensive co-ax. He tells me that in the hills of Kentucky, where he lives, people living at the bottom of a hill put their TV, CB and ham antennas on top of the hill and run 4 wire lines several hundred feet to the bottom of the hill with great success.

RTTY DX Notes 1of3 9/21/90

RTTY DX Notes for week ending 21st September 1990
BID: $RTDX0921
Part 1 of 3.

Despite the remarks of packeteers about the slowness of AMTOR (and for
that matter RTTY), it would appear that someone has their figures
badly wrong. I have seen packet messages take 12 to 14 days to get
across the USA and another 5 days to be delivered to Sydney. As a
matter of interest and test, I asked a station in New York to send me
the same message by AMTOR and packet. I received the AMTOR message in
12 hours and the packet message via APLINK in 9 days. Oh, heck.
Possibly my calculator was wrong. All this to say that there appears
to be more and more stations using AMTOR to pass their traffic. One
wonders if they are realizing that after all, on HF, AMTOR is best.

Our thanks this week go to I5FLN Cluster, JA1BLV, OD5NG, TG9VT, W2JGR,
W6/G0AZT and the Tri-State DX Packet Cluster Network. Thank you all
for the informative DX Notes.

QSL Information.

TA3D informs us that his QSL address is Box 963, Izmir, Turkey.

S79NBD is JG1NBD when he is at home.

5W1KT says to QSL to Box 1672 Apia, West Samoa.

YS1RJ collects his cards from Box 792, San Salvador, El Salvador.

J28TY QSL address is Box 2417, Djibouti.

HV3SJ says to QSL for this contact to I0DUD.

Cards for the latest 3DA0BW operation go to Paul, Box 57 Big Bend
Swaziland, not to AK1E as for previous operators.

V63AR is JA2NVY when he is at home. QSL via callbook address.

Notes of Interest.

JH1QDB, Kuni, will operate from Ogasawara JD1 from September 23rd to
30th. QSL to his home call.

W6/G0AZT has told us that he will be signing ZF1RY from 27th September
and through the CQWW RTTY Contest. QSL to his home address.

Juan Fernandez. F2JD expects to be signing CE0ZZZ mid November for a
period of about one week. RTTY gear by IRDXA.

Malpelo (HK0) is still indicated for 2nd November. Financial
assistance should go to HK3BED at his callbook address.

South Sandwich VP8SSI and South Georgia VP8SGI are still on track for
November 26th and December 1 respectively for a week or so operation,

RTTY of course. Financial assistance should go to AA6BB/7 or KA6V/7.
Callbook address is OK.

GL DE DX1.

I guess we all basically get what we pay for. :-)

> I was wondering if anyone might know where I might get some coils, or how I
> may go about making some perhaps?

I have an EICO Model 710 Grid Dip meter, which is probably what
you have. I have no manual for it, however. I will tell you what I know
about the coils, and perhaps other readers can add to it.

The EICO model 710 uses eight coils labeled "A" to "H" to cover
the frequency range of 0.4 to 250 MHz. The lower frequency coils have
a tapped winding, while the upper frequency coils do not. The following
chart tells you all I know:

COIL FREQUENCY TAP DESCRIPTION OF COIL
"A" 0.4 - 0.7 MHz yes lots of turns of Litz wire & tuned slug
"B" 0.7 - 1.38 MHz yes lots of turns of Litz wire & tuned slug
"C" 1.38 - 2.9 MHz yes lots of turns of Litz wire & tuned slug
"D" 2.9 - 7.5 MHz no approximately 30 turns of 28 AWG enamel
"E" 7.5 - 18 MHz no approximately 15 turns of 24 AWG enamel
"F" 18 - 42 MHz no approximately 6 turns of 20 AWG enamel
"G" 42 - 100 MHz no approximately 2 turns of 18 AWG enamel
"H" 100 - 25 MHz no 1/2 turn U-shaped 0.125" wire loop

The coil forms for "A" to "G" are all 0.75" plexiglass, with
the coil winding being about 2" from the pins.

Armed with the above information and some trial and error, you
could probably duplicate the required coils.

1405. Performance of QRP/homebrew transmitters and receivers

Newsgroup: rec.ham-radio
Date: 1990-09-24 01:10:47 UTC
From: norlin@uokmax.ecn.uoknor.edu
Message-ID: <1990Sep24.011047.8509@uokmax.ecn.uoknor.edu>
Source record: 8265

Several years ago, I obtained a Novice license. Being 12 at the time and having no money, I never managed to purchase any equipment nor was I skilled enough to build anything that worked. My license expired.

Now, in college with a little (emphasis on little) money of my own, I have begun to look at the hobby with renewed interest. Although I still do not have money to burn, the hobby is not as unreachable as it was before. But before I consider getting a license, I am again faced with the problem of how to get on the air, cheap.

It seems to me that the most inexpensive, educational, and satisfying way of getting one's equipment is to build it oneself from circuits in magazines, books, and the like. Performance, however, is always a question. Is it realistic to expect to be able to have any communication at all with, for instance, a one or two transistor crystal oscillator? In almost every publication I have seen, a crystal oscillator is shown as the simplest "transmitter," but no indications of actual useability are given. Has anyone out there gotten reasonable performance out of a one/two transistor oscillator?

On a similar note, is it feasable to build a useable (in terms of CW selectivity/sensitivity) simple receiver? (For me, "simple" means the circuit diagram will fit easily on one page -- a couple of transistors and IC's.) I have experimented very briefly with a regenerative circuit but it left much to be desired.

Any pointers on where to find circuits for good, simple receivers/transmitters (if such circuits exist!) would be greatly appreciated. Thanks in advance!

> FM years ago.
>
Ah, New Zealand. So now we have a named country that is supposed to use FM in the aviation band. A lead I can follow up on. Time to work some DX and get this confirmed. So I reach over and grab my 2500 set (AT&T of course, none of this imported stuff). Dialing 011649NNNNNNN I call Ian Ashley, ZL1AOX in Auckland. This is the ZL1AOX of Amsat fame. He is at work, so his Mrs tells me he will be back after lunch.

Ian is a senior pilot at Air New Zealand. A pilot and radio amateur, who better to answer the FM in the air bands question. I asked Ian if they used FM in the Anitpodes. He was to say the least, dumbfounded. He said that the airbands use AM all over the world, even in New Zealand. Yes, on HF, it is now SSB, but all the VHF stuff is AM. Ian flew domestic Air New Zealand flights for years. He now flies internationally. Next month he will be flying out of LAX (Los Angeles) until December.

He agreed, that having some areas FM and some AM would require all planes flying internationally to carry an FM radio, just in case.

So it appears, that AM is the world standard still. Maybe the ATC in NZ assumed his radio was FM, assuming that FM means VHF, as it does to

many people.

Ian did also say that some carriers may use FM business band for
company messages air to ground, but all ATC "Air Band" stuff is AM.

Message-ID: <303@aupair.cs.athabascau.ca>
Source record: 8262
Cross-posted to: rec.radio.shortwave,rec.ham-radio

I've received about 15 requests for this info, so far. It's getting a
bit out of date, so I suggest you contact Norsat for current info.

Note that I don't use their product or services. From what I can see
in the B.C. map files, they don't have the greatest Usenet connectivity.
(They don't appear in Brian Reid's top 1000 sites, either.) I've edited
as much of the commercial hype out of this as I could without loosing
too much of the technical info.

They broadcast on ANIK-D1 and GE-K2.

What MICROSAT II is:

MICROSAT II is an audio/video/data satellite receiver you can install in an
XT/AT bus personal computer. By integrating several functional units onto a
single PC expansion card, and using the computer for control and data
capture, Microsat brings reduced cost and size of satellite downlink
equipment to users of satellite communications.

You don't need an external satellite receiver to use MICROSAT II or to
receive data directly to your computer, MICROSAT does that for you!

What MICROSAT II does:

With an appropriate antenna/LNB, Microsat can be tuned to receive signals
at any frequency in either C or Ku Band. The tuning functions are controlled
directly from the computers bus, or can be set in hardware to ignore the PC's
commands. Video and stereo audio outputs are provided, and data received is
routed to an RS-232 standard serial port.

What you receive using MICROSAT II:

Satellite TV broadcasts, stereo radio stations carried on subcarriers, VC-II
encoded broadcasts (when equipped with a VC-II descrambler).

The full USENET news broadcasts including ... alt, bionet, biz, can, comp,
control, general, gnu, misc, net, news, pubnet, rec, sci, soc, talk, to, u3b,
unix-pc and vnet.

What Hardware Is Required:

MICROSAT II and CYCLONE work best together in a computer with at least:
1 AT/XT Bus computer, (standard PC)
1 hard drive (10 Meg or more)

1 video card (most types supported)
1 asynchronous serial card (standard RS232)
1 satellite dish (for C or Ku Band)
1 MICROSAT
1 floppy drive (for the distribution diskettes)
or
1 modem (fetch software via BBS or uucp)

What Operating Systems are supported:

Currently "DOS" version 2.11 or higher is required for the CYCLONE receive software, while the transmit software runs under SCO XENIX 2.3.1.

A UNIX version of the CYCLONE receive software is scheduled for release mid-August 1989.

What Software Is Provided:

The MICROSAT II comes complete with the CYCLONE receive software, which depacketizes the satellite data and performs the forward error correcting and detecting functions. Data integrity is ensured by standard CRC-32 error detection algorithms and is corrected BEFORE it lands onto your computer.

The CYCLONE software uses a forward error correction scheme loosely based on existing error correction schemes like Reid-Solomon and BCH coding but is optomized to provide low overhead on the receiving computer with the calculation intensive tasks being done on the transmitting computer.

Resource Management:

The CYCLONE software is designed to make the best use of your computers resources and to minimize maintenance. All data arriving on the computer includes addressing information such as NET, GROUP, USER, MAJOR and MINOR classifications as well as complete file system information about the file.

Incoming data can be selectively routed to subdirectories on the hard disk, printers, comports, networks, or fed as input to programs that may be dynamically configured according to the type of file being received. CYCLONE keeps track of how much data is delivered to each resource and honors the limits you specify in the configuration file.

Files can be selectively received based on classification, age, and to some degree content itself (header packet information).

How To Get More Information:

You can contact NORSAT International conventionally via phone/fax or Mail or you can request information via uucp or the support BBS.

mail: ATTN: David Binette

Yes, Steve, it's still quite active. I just copied it today for the morning
and evening passes, and just scanned the captured data again. I don't see
anything new on the digitalker in the bulletins...Still the same
text about the AIAA/US small satellite conference.

If you hear the digitalker, please drop me a line...don't want to miss
that one.

I've seen descriptions of modified AM (0.54-1.6Mhz) radios for ham band reception. Basically, you treat the radio as a tunable intermediate frequency amplifer, and you put a downconvewrter stage in front of the radio's front end. You need to put the radio's loopstick in a shielded can, so you don't continue to receive AM radio stations. You will also need to build a Beat Frequency Oscillator (BFO) to inject into the radio's IF strip. This is an oscillator running at the same freqency as the IF amp, and acts as a substitute for an AM radio station's carrier. Inject it at the diode detector stage, so you won't confuse the radio's automatic gain control. Now, you can hear "dit-dah-dit-dit", instead of "hiss-hissss-hiss-hiss".
Old copies of the ARRL handbook (or old QSTs) I think had diagrams of this sort of thing.

Over the weekend, there was a "public safety" expo at the local mall. Got talking to one of the aux communications guys, after noticing some ham HTs on display. Mentioned about the discussion we had on this net about 6 months ago about hams using their modified HTs to contact police depts on police radio frequency. He said that we should *never* do that unless it is an extreme emergency (where someone is about to die, like in a car accident) and you have tried all other methods of communications (like the ham repeater, knocking on house doors to get them to call the police for you, etc.). The FCC may say that it is OK, but the police will not like it, unless it was an extreme emergency, and you tried other methods first (and they still won't be happy).

1410. Re: 2m to Mexico?

Newsgroup: rec.ham-radio

Excerpts from the ARRL handout on operating in Mexico
[dated June 1988, approx.]

The United Mexican States has not entered into a reciprocal licensing/operating agreement with the United States (though the two countries share a third-party traffic agreement).

Mexico, however, issues operating permits to U.S. amateurs on a courtesy basis. Upon arrival in Mexico, visit the nearest Delegacion Regional de Concesiones y Permisos de Telecomunicaciones. There are many offices througout the country, and a list of them is available from the ARRL Regulatory Information Branch for a business-size SASE.

You should take the following:

- A written request for a temporary operating permit, which contains information on your equipment, address in Mexico (friend or hotel/motel) and automobile.

- A copy of your tourist card or visa (issued free of charge by the Mexican consulate located in many U.S. cities or by the immigration office in Mexico).

- An HD-1 tax receipt for a license fee (37,000 pesos, or $26, as of September 1987) paid by you at the nearest Office of Secretaria de Hacienda y Credito Publico.

- A copy of your FCC license

[stuff deleted]

Guest operation by foreign amateurs of XE stations is permitted.
[stuff deleted]

Phone patch operation is discouraged except in emergency communications.

The following are editorial comments by KB0CY (based on talking to several US amateurs who hold XE licenses)

* The actual procedures seem to vary, depending on where you are in Mexico.

* The license is good for the same length of time as your tourist card which is usually 6 months. It is not easily renewed -- it requires the same fee & hassle all over again.

* It takes about 1/2 day to obtain the license (if things go well).

* The latest info can be obtained from the ARRL for an SASE.

* Contacting a local amateur or someone who has obtained a license recently is very helpful.

I was refered to this group by some on reading another group I had posted this in. I am in quiring about a British made radio for the 1947 Bently Mark VI. It's frequencies are measured in metres and it was made from 1946-1951. I have info on who rebuilds these things but I also would like some technical info should I want to rebuild it my self. Can anyone help. Thanks!

Hey! The 710 is the very animal that I have. (Eico 710, 8 bands from .4-250 MC)

Any one have any hints on how to create and tweak coils for this animal?
Pretend I don't know anything about building resonant coils for dip meters,
and you won't be far from off. (I have had a lot of work with resonant
loads, from antennas to resistance networks, but have never worked with
dip meters - perhaps I would have been more successful if I had)

Thanks.

swood

> anyone out there gotten reasonable performance out of a one/two transistor
> oscillator?

You can have quite good results with power outputs in the 100 mW to 1 W range; easily obtained with a couble of transistors. Crystal control is easier to design and get stable operation with, but it really isn't that much more difficult to get a VFO running.

> On a similar note, is it feasable to build a useable (in terms of CW select-
> ivity/sensitivity) simple receiver? (For me, "simple" means the circuit
> diagram will fit easily on one page -- a couple of transistors and IC's.)
> I have experimented very briefly with a regenerative circuit but it left much
> to be desired.

Don't bother with the regenerative receiver, except as an exercise in history. The simplest receiver is the "direct conversion", and while it has it's drawbacks, it is entirely usable.

Be careful that you don't set unnecessarily stringent performance requirements for your rig. It is nice to have a real hot-dog high-tech multiband transceiver with 120 dB 3rd order IMD, 250 Hz CW filters, 1 Hz resolution synthesized VFO, etc., but neither you nor I can afford one of those. To compensate, I have occasionally set as a goal something like this:
"Design and get working the cleanest 40 meter CW transceiver possible, using less than 100 mA @ 12V, and fit it on a 3" x 5" circuit board."

This gets me on the air, and instead of feeling ashamed of my rig, I am (justifiably) proud of it. Just get on the air!

One of the best sources of information on homebrewing (especially small-scale homebrewing) is _Solid_State_Design_For_The_Radio_Amateur_ , by Wes Hayward and Doug DeMaw, published by the ARRL. The cover price on my issue is $12.00, and it has more usefull information than most $50.00 textbooks. _The_ARRL_Handbook_ is also an essential source for the homebrewer.

If you, (or anyone else,) would like to brainstorm some more on the topic of homebrewing, let me know. My "hot buttons" are SIMPLICITY, ELEGANCE, SMALL SIZE, LOW COST, and the ever elusive WOW, THAT'S *NEAT!* factor.

1414. Trap Antenna VS. Random Wire/Tuner?

Newsgroup: rec.ham-radio
Date: 1990-09-24 16:58:46 UTC
From: stoppani@rust.zso.dec.com
Message-ID: <1323@rust.zso.dec.com>
Source record: 8284
Cross-posted to: rec.radio.shortwave,rec.ham-radio

I currently have an ICOM R70 connected to a 70' wire antenna
and am wondering what is the best step to take toward a better
antenna system. The choices that I've considered are the
following:

1) Get an antenna tuner and use it with the 70' wire.

2) Get an antenna with traps (Alpha Delta Sloper).

3) Cut my wire antenna to the most useful length for
the broadcast bands (vs HAM bands where it seems that 66'
is a popular length).

What I'd like to know is what are the advantages/disadvantages
of each option and which one will get me the most bang for
the dollar?

Also, what do others do about protecting their radios from
spikes from the antenna caused by static electricity and lightning?

Thanks in advance.

What about buying older tube-type gear and then rebuilding it?
There are some excellent tube-type rigs out there (Collins, etc.)
that you could buy and repair. IMHO, it would be much less trouble
than building from scratch, although a successful homebrew IS very
satisfying.

See later comment about RSGB being elitist clique

>of the British amateurs are no-code licensees, yet they write
>only 5% of the technical articles, I conclude that the British

How does the saying go? 'Those that can, do; those that can't, write'

>no-code license is a refuge for less-technically-capable people,

I feel insulted by the above statement. I do not consider myself
'Less technically capable' just because i am unable to behave as
a rather inefficient modem!

>even though the minimum entry level is set by the same written
>examination as for their full license. I doubt that a no-code

The RSGB only represents about 1/2 of the amateur population in the
UK. Many UK Hams consider the RSGB to be an elitist clique.
The 'Technical articles by no-code licensees' are ghettoised into
the Packet and Microwave Newsletters (available at extra cost!) and
so will not appear in the citation-counting referred to above.
The RSGB do NOT represent the whole of the UK ham population by
any means.
(BTW, I am a member of the RSGB; trying to change the organisation

from within)

>
>25. While researching the technical level of no-code licensees in
>Great Britain, I came across a requirement of the British licens-
>ing regulations that must become part of the US regulations,
>should the Commission adopt a no-code license. The British

But you dont *HAVE* to slavishly copy *ALL* our mistakes!

>correctly assume that, since their no-code licensees have not
>demonstrated their knowledge of the Morse code, the code they
>send may be unreadable. Thus, the British require no-code licen-
>sees to identify their code transmissions by voice. This means
>that no-code licensees may only use code in those band segments
>also authorized for voice.

There are no such 'Voice-only' bands in the UK!!.
The 'band plan' is entirely voluntary. We are allowed to identify
using voice *OR* Morse (and are required to do so when operating
Packet/SSTV/RTTY/FAX *IRRESPECTIVE OF THE CLASS OF LICENSE HELD*)
To us Europeans, the idea of 'CW-only', 'Voice-only' etc subbands
looks like restrictive and Stalinesque behaviour by the FCC.

IMHO, denigrating us no-coders because we fail to write/publish articles in
RADCOM is false... Are you similarly going to denigrate all those who are
involved in radio but who dont hold Ham licenses as being 'second class
citizens' because they dont take the Ham exam?
I fail to see how learning CW would in any way further my ham radio interests
since even if forced to learn it, I would be unlikely to ever make use of it.
(Machines are so much better at reliably copying digital data, whether it
was originally generated by man or machine ; damn it, they can even do it
when i am not there!).
Why should i have to be a modem? You might as well expect me to generate
RF direct without the intervention of electronics.
(Maybe that will be the next thing in incentive licensing; proven
ability to hold QSOs by telepathy?)

In addition to the other comments, I'd add that the Hallicrafters you made your tests with probably has no noise blanker. I would expect the impulse-type noise from the corona to be a good candidate for elimination/great reduction by a noise blanker. In fact, you might want to see if you can get your hands on some various modern radios with blankers to try: some are much more effective than others...

Date: 1990-09-24 19:35:25 UTC
From: jak@mtune.ATT.COM
Message-ID: <805@mtune.ATT.COM>
Source record: 8272

In helping the wife of a local silent key dispose of his shack, I have come across a new (unused) Jennings Radio vacume variable. It is a double (gang?) cap with a chain drive linking the two sides. THe entire unit measures about 18" x 18" x 4". It is marked 15,000V and T85Q?A25060 (some digits are blurred and one is unreadable).

Does anyone have an old Jennings Radio catalogue? WHat did this thing cost new? What do they go for in flea markets these days?

Thanks for any info.

Yes, you can build simple receivers and transmitters that work well enough to make lots of contacts on the air. Direct-conversion receivers have the advantage that the local oscillator can be used as the vfo for the transmitter.

On the other hand, the time spent building, testing and troubleshooting the equipment adds to the time before you can get on the air. And you can spend lots of time and never get it working properly which can be very discouraging. I recommend you buy some used equipment to get on the air. For $100 or $200 you can buy a HW-101 with all needed accessories. Now at least you can get your feet wet transmitting while you experiment building equipment.

1424. Help with AEA PK-232 and Ka9q package. . .

Newsgroup: rec.ham-radio
Date: 1990-09-24 20:10:30 UTC
From: gary@ellis.uchicago.edu
Message-ID: <1990Sep24.201030.23612@midway.uchicago.edu>
Source record: 8283
Cross-posted to: rec.ham-radio,rec.ham-radio.packet

Was wondering if anyone in net-land could help me with this.

I have packet station consisting of a MacSE, AEA PK232 and a Kenwood 731A. I'm trying to get the ka9q TCP package to work. The software starts up fine on the Mac - no problem. But, I'm unable to make any connections. Specifically, my first attempt, as a test, was to try to get the AX.25 protocol to work to connect up to my local Net/ROM node - CAPRA (Chicago Area Packet Radio Assoc.)

The ka9q software will not key the transmitting and I'm stuck in a "connection pending" condition. I have some thoughts on this and think the problem is that I have not entered KISS mode on the PK232 with the correct parameters.

As far as "nornal" packet operation is concerned... evertthing works fine so I know I have the connections (cables) set up properly.

I have PK232 firmware dated 19.Jul.90. The Tech manual gives a set of instructions for what paramters need to be set before going KISS. The 19.Jul.90 firmware revision says all I need to do is say "KISS ON" and warns that entering KISS mode sets certain parameters.

So, if anyone out there has any insight on this - I'd appreciate it. If anyone has a PK232 and a MacSE running ka9q ... can you verify that in fact this works... or does not work... or disclose the incantation that will make it work.

Thanks,
Gary (New packet user)

>
>Are you sure this is the reason? Why then don't all critical transmissions
>take place on AM? I scan local police regularly. When they have broadcasting
>collisions they are always quite noticeable and they're using FM...

From what I remember, most narrow band FM receivers will capture only
one of the transmissions if it's approximately twice as strong as
the other (3dB). If it's more than 3dB down, the interfering signal
may still cause some distortion of the stronger signal, but to a lesser
degree. The weaker the offending signal is compared to the stronger
signal, the less noticible the interefernce will be.

In your local police example, the various officers are almost
always within DFQ range of the repeater, so typically collisions will
be heard since the signal strengths are relatively close. In an
aviation situation, one plane may be nearing the runway while
another is 100 miles out. In this case, the nearby plane would
probably totally mask the other on FM, but on AM, there would
still be noticible distortion.

> Pretend I don't know anything about building resonant coils for dip meters,
> and you won't be far from off.

Get some 0.75" OD plexiglass tubing and cut it in 2.5 inch lengths.
You'll have to use some ingenuity in fabricating pins to fit the socket
on the end of the grid dip meter. Heavy solid wire, like some tinned
12 AWG may be about right.

The grid dip meter is tuned *solely* by the inductance of the
coil; there is obviously no bandswitch on the instrument. While the
3 lower frequency coils may be tricky since they are tapped and I cannot
estimate the turns, the higher frequency coils from 2.9 MHz to 250 MHz
should be easy to build.

Just start with winding a coil based upon the description in
my previous article. All you need to test is a sensitive frequency
counter. Set the scale on the grid dip meter to a given frequency.
Take the test leads from the counter and loosely wrap a turn around
the coil form for inductive coupling. Merely add or remove turns on
the coil until the grid dip meter calibration matches the reading
on the frequency counter.

These coils, by the way, are not exactly hi-Q, so I wouldn't
sweat your fabrication technique.

I can't do much more than tell you the above.

Subj: radio prop. in a nuclear war

Don Perley writes:
> If there is a nuclear war, I don't think cancelling ham radio will
be a high priority action item in the 2 hour war scenario.
I don't think that what is meant is to cancel it. Propagation will be
totally disrupted, and cancelling won't be necessary. Probably tyhe only
radio contacts would be by very low frequency ground wave propagation. But
you have a good point in that within a short time the point would become
moot following a full-scale nuclear exchange. World powers are aware of
this and are gravely concerned about it, botu I'm not so sure of "emerging"
and third-world countries. Are there any ham bands below 100 kHz?

But if you've got a working grid dip meter, you can tell him
the inductance of the taps on the coils; just clip a capacitor
onto the taps and measure away with ... a grid dip meter. Since the things
are low frequency coils with the inbuilt tuning capacitor (circa 50 pF),
this will likely require using either another grid dip meter, or measuring
only the higher-frequency tapped coils ('cuz you're unlikely to be able
to estimate the stray capacitance better than a large fraction of
that 50 pF.)
The inductance, of course, goes as the square of the turns
ratio.

ajs@hpfcdc.HP.COM (Alan Silverstein) writes:

>> Do I have to know Morse code or has that changed?

>Yeah, unfortunately, 5WPM.

Actually, no. You have to pass a 5 WPM test, but that has little to do with actually being able to copy code at 5 WPM. Here's what you do:

Learn as many as you can: E, T, R, I, N, O, A, and S is a good start. Also learn the numbers pattern.

During the playing of the tape, write down the dot-dash sequences, rather than the letters. The tape goes so painfully slow that this is actually a workable strategy.

After the tape is over, you have as much time as you want to play "fill in the blanks." Fill in the ones you memorized, then try to figure out some of the words. "T _ E" is likely to be "THE". Then if you find the same pattern as the "H", try putting an H in those other spots as well.

Most VEs give you a choice of passing by 1 minute of solid-copy, or getting 7 out of 10 on a multiple-choice content quiz.

Using my "learn 8 letters and bulls__t" method, 5 out of 6 people I've recommended the method to passed on their first try. The remaining one did it on his second try. Can any of these guys work CW? Probably not. All of them immediately went on to Technician and are 2 meter and packet operators, so they really could care less.

Is this against the spirit of the rules? I suppose. Is it illegal? Heck no, unless the FCC decides to change the test requirements. Is it blasphemous? That depends on how much flame-mail I get from this post, doesn't it? :-)

My stance on no-code? Two licenses: Technician and General. Technician has a 50 question mostly rules test, but grants no HF privs. General has a 12 wpm code test and a 20 question mostly theory test, and grants current Extra privs. The ARRL would probably freak, but anyone who's seen my QSL card knows what I think of them... :-)

Well, let me mosey on over to the fire extinguisher and don my asbestos long-johns...

+
+Speaking of mysterious carrier signals, how about the one at 28.636?
+It is the 8th harmonic of the TV colorburst frequency. Those TV sets
+that surround us are quite strong even at the 8th harmonic.

Just wait 'til digital TV comes out in a big way! The digital system clock
will be a harmonic of the 3.579545 Mhz colorburst freq. So, you'll hear

7.15909
10.738635 (should be interesting for FM bc radios!)
14.31818
17.897725
21.47727
25.056815
28.63636

TVs with picture-in-picture have digital circuitry (you need a digital memory
to store the info, it's a FIFO that operates at erattic speeds and delays).

One thing that should help us some: the 16th harmonic of 3.579545Mhz is in the
middle of TV channel 2 (57.27272Mhz). So, the TV will need to have its
digital stuff well shielded so you could watch channel 2.

Message-ID: <9009251409.AA21486@tincan.sawyer.af.mil>
Source record: 8310

Yes FM is used in aviation, but not directly for ATC purposes, and not in the 116-136 MHz band. The are a number of devices on the market, mostly used in non-US areas, which are basically cross-band repeaters. These serve two basic purposes. First, they can relay tower comms to a remote AM transceiver rather than run phone lines up to a hilltop. Secondly and more common, they are used to allow ground crews parking, servicing, etc, the aircraft to hear and/or talk to the aircrew. Check some commercial publications, international trade journals, JANE'S, etc for info on these. I know Motorola does make a cross-band repeater controller for this purpose, but for international sales only. I have seen others also, but don't remember where I read about it.

I have been in many towers, and have worked on ATC radio and console equipment for many years. I know a lot of controllers and a lot of pilots. Very few have been incredibly technical. I found some controllers who were flabergasted when they found out that their radios were not located in the console, and even more astounded when they found that some were many miles away. To talk about FM/AM to some of these folks would not be much different than talking the difference between a Saturn V and a V-2 to the average five year old. (Before you turn up the heat, this is not to imply that controllers and pilots are stupid or lack intelligence. technical aspects of the equipment is simply not their required area of expertise, and they simply lack the information. I generally (:-)) have a high regard for both pilots and controllers.)

Next time you have time to kill at an airport, look up the maintenance folks and spend some time with them. They can usually show you the equipment and talk smartly about it. You will probably surprise them. Everyone wants to see the tower, but no one ever wants to see what makes it work.

Anybody care to venture a guess what transmission mode will be most successful just after the initial EMP ? No... It couldn't be ... HF CW ? Gak. That's even scarier than The Bomb itself.

It certainly wouldn't be packet, because all the digipeaters on those high hilltops will have had the smoke let out of them. Ditto for VHF NBFM repeaters.

More serious question - assuming high atmospheric ionization, which band comes back first ? 160 meters ? Will UHF/VHF simplex work first ?

Rather than "nonresonant", I prefer to think of a fat antenna as "wideband".
Radiation characteristics are unchanged by L/D ratio.

Re: aperture

If you're concerned about capturing more microvolts at 70 cm, try a more
complicated antenna, like a center-fed 3/2-wave, loop, or collinear design.
All have better gain than a dipole.

The Harris RTX-2000 is a RISC high speed Forth engine (no, that isn't an oxymoron in THIS CASE ;-) which has many of the attributes of a DSP chip. I won't go into the details here. It IS being used as both a DSP chip and as a disk controller on the ram disk on board.

This is part of the RUDAK experiment that was built by the AMSAT-DL RUDAK group in Munchen, Deutschland (Munich, W. Germany). This will be RS-14. It will be called Radio Oscar 21 after launch. This will be the first SU launched satellite done in conjunction with one of the `western' satellite building groups (AMSAT-DL/RUDAK) and with some participation after the fact by AMSAT-NA folks. The group in the SU, in the spirit of cooperation, etc. etc. have chosen to have it be the first satellite to join the OSCAR numbering scheme. Just as UOSAT-A is UO-9, RS-14 will be RO-21. Fuji-2 was FO-20 and this will be the next in line.

Well, I've decided to join in on the fun and purchase an HT.

It seems that a lot of you out there already have an HT and I can't think of a better place to ask for opinions. ;-)>

I've narrowed down my decision to the IC-24AT and the FT-470. Both of these look like real whiz-bang little toys. The FT-470 is a lot cheaper, but a little bigger, and heavier. The IC-24AT can do amazing things with a few mods but would lighten my wallet quite a bit. So which has the most bang for the buck?

If you have experience with either of these two babies, I'd really appreciate it if you would send be a note on what you think. I'll post a summary of the results.

Thanks in advance,
-Tom

>welcome.

I don't know what to do for a few uF, but if you're after a few hundred
pF, I can recommend teflon printed-circuit board. (Don't use
regular epoxy board for high-power RF; the losses cause enough heat
to burn up the board.)

Etch the copper a tenth of an inch of so around all the edges so it
won't flash over. If you need over a few hundred volts of RF, you
will have to coat the board with an anti-corona material. Spray
it on to avoid bubbles. Best is high-voltage paint ("dope"), but
I seem to remember that hardware-store spray paint works well too.

If you ever open up a Drake MN-2700 kilowatt antenna tuner, check
out the fixed HV capacitors mounted under the "bread slicer" variable
caps. They are constructed this way.

Howdy:

I had such great luck recently with the help needed message for the RTX-2000 that I thought I would try again. I need a couple of COSMAC 1802's. I could also use whatever manuals you may have such as programmers and user reference manuals. The indigenous system I have for it is a variant of FORTH (called IPS by its designer, DJ4ZC). This chip was originally done by RCA. If you have some laying around and have development tools you aren't using, let me know. The COSMAC 1802 is in the integrated housekeeping unit (IHU or OBC = on board computer) in Oscar 10 and Oscar 13 and planned for Phase III D.

In the Boston area, DOVE has been making its evening pass around 9PM EDT -- you may have to widen your listening hours to catch it. To get your TNC to show you something, be sure and set PASSALL ON. I listened many times and got nothing until someone tipped me off to PASSALL. (I did get lots of copy from (*ahem*) people trying to connect to the DOVE though -- I'm sure it was an honest mistake on thier part.)

1451. Needed: ICOM 2SAT Mods

Newsgroup: rec.ham-radio
Date: 1990-09-25 19:39:00 UTC
From: RHAREL%FAB8@SC.INTEL.COM
Message-ID: <9009252058.AA00889@ucsd.edu>
Source record: 8300

I know of someone who has the European version of the ICOM 2SAT
handie talkie and was able to modify the receiver to go from
80 Mhz up past 174 Mhz by reseting the uP. He did this all from
the keypad. When tried on the American version - no go.
Can anyone tell me if this Rx mod is possible on the American version ?

Tnx,
Rich

1452. Re: IC-24AT vs. FT-470

Newsgroup: rec.ham-radio
Date: 1990-09-25 19:56:31 UTC
From: young@dynamo.ecn.purdue.edu
Message-ID: <1990Sep25.195631.6720@ecn.purdue.edu>
Source record: 8317

I have the 470, and I like it. The 24AT was too much for my wallet, anyway. With the correct key sequence, the 470 does cross-band repeat (though I don't need this very often). I do use ALL the memories on 2M, and about half of them on 440. The 2M receive opens up easily to 130-180 MHz, thus several of the memories are police, fire, NOAA, etc. A buddy put the rig on his $10k service monitor, and was astonished at how hot the receiver was. < 0.1 uV at 146 meg. Lighted keypad is nice, though I sometimes wish the lamp button was push on - push off instead of momentary. Dual-band rubber ducky works well. It would be neat if the 440 receive could be extended, but I haven't seen any postings of such a mod.

Some 470 users report intermod problems in high-RF environments; I don't often have that problem, but I hear that Yaesu will do a free mod for those that do. It allegedly involves moving one of the IF's and realigning. The new ones probably don't need the mod at all (already done at the factory).

Signal reports have been consistently good with this unit, and it's built fairly small but solid. I use the 7.2V 600 mAh (FNB-17) pack and the stock vinyl case. Around here, I almost always use lo power, and battery life is very acceptable.

Biggest drawback to this rig is the miniscule speaker. I frequently use an earplug, even inside a vehicle. Maybe someone would be interested in working up an audio-boost mod! :-)

Hope this helps. 73s!

1454. Re: IC-24AT vs. FT-470

Newsgroup: rec.ham-radio
Date: 1990-09-25 20:04:27 UTC
From: mead@hamal.usc.edu
Message-ID: <27286@usc.edu>
Source record: 8319

FT470: better usage of the computer.
- uhf rec coverage doesn't seem easily expandable
* memories can be programmed with separate tx & rx freqs
which supports any odd-ball offset you may run into.
* recalled memory can be tuned without having to switch back
to vfo mode
* pl decode freqs can be tuned thru while receiving, if you are nosey
* true dual receive, tho I usually leave it off.
* lighted keypad (I miss this on the IC-24)

IC-24AT: can't do the 4 * above
- boneheaded programmer of computer made the tx offset step
25khz, instead of a more usable 5khz
- viewing angle of lcd display is narrow
- small, recessed keypad harder to use, especially if you have
big fingers, and also if it's in the dark.

* more ruggedly built (my impression..)
* very wide expaned rec range (varies with each radio, however)
I get <2uV sense 118-135,138-178,335-485,800-960Mhz
* it is cheaper.

My observation is that Yaesu makes much better use of a computer, while
skimping on the ruggedness factor, while Icom makes it more drop-proof
and hires brain-damaged (or fired Yaesu) programmers.

I bought an FT470 some time ago, I do notice, even after the factory mod,
that it is very prone to intermod. But that is a fact of life for any hot,
wide coverage receiver in the L.A. basin.
I recently broke down and got the IC-24 thinking I would sell off my FT470
and while I grumble about the shortcomings of both, each has something I
like (but not in common), so I'll probably just keep both handy.
I suggest, if you want wide freq coverage and can live with the price and
shortfalls, get the Icom....If you want good ham-band functionality and
less pocket-picking, get the Yaesu. Or, like I do, ignore any advice and
get what you like...

I have never got a successful copy of any data off of DOVE (Packet
gear bleeds onto the DOVE frequency), but am going to keep trying.

-Steve Schallehn, KB0AGD

For the past month I've had the second port of my KPC-4 connected to a scanner
with one of the 16 channels set to 145.825. It's a pretty lousy way to copy
packet but what the heck - the second port on the TNC isn't being used until
my 51.7 Mhz xtals arrive. One morning DOVE was coming in loud and clear -
actually woke me up. That was the only time a "DOVE-1" showed up in the
"heard" list. It was sure a thrill to see the callsign from space.

Source record: 8306

>>> Can I build a simple rig ...

There are many QRP rigs (mainly CW) whose schematic will fit on a single page. A good source of these and many other homebrew ideas is SPRAT - the journal of the G-QRP club.

As an example, here's the Table of contents from the Summer 1990 issue (it's published quarterly):

AF Preamp & active filter for NE602 Mixer
28MHz Transmitter (with four transistors)
An SMD (surface mount devices) Iambic Keyer
One toroid AF Filter (giving LP, HP or Notch responses)
Disco Display (an ATU with a visual display)
Varicap VFO (with PCB artwork)
Surface mounting VFO & Source Follower
Surface Mount technology - Ham style (on the virtues of dead bug/ugly construction)
Suitcase Magnetic Loop for 40 - 20m
Huff & Puff Revisited (a simple frequency locker for any VFO)
QSK for CTX80
A Battery & SWR indicator with a Duo-Led
Quality Audio Amplifier for Receivers (with artwork)
AGCW Contest
Communications forum - SSB, VHF and Members News

Of the 44 pages 28 are constructional, 8 are members news ... and 4 are ads, 1 editorial and one of upcoming conventions.

This is one journal I really look forward to getting - the editorial policy on articles is something like "draw a circuit and outline how it works, we'll take it from there". The now has over 4500 member worldwide.

Annual Subs are US$10 or five Pounds.

For more info, write to:

Rev George Dobbs G3RJV
St Aidans Vicarage
498 Manchester Rd
Rochdale
Lancs OL11 3HE
England

For those of you that like gear that you can build yourself look no further.

Hope this is of use ... :-)

Oh, that sounds like "SOS at Midnight", by Walter A. Tompkins (ham call K6ATX), if memory serves. I remember reading it in the early sixties when I was in junior high school. Later, I bought a reprint of the book from the ARRL (American Radio Relay League, Newington, CT) and reread it.

The author wrote a small number of other books similar to that one and they were (are?) also available from the ARRL. The ARRL was peddling them with the suggestion that they would make a nice gift for a budding young ham. (I donated mine to the local library).

BTW, the period of the novel was in the late 50's, judging by the hero's radio gear (a Heathkit DX-100 transmitter).

Gary Bishop asked about cleaning old capacitor gears. Well, you could use gasoline. just immerse the gearing in a small amount of gas in a coffee can or other container. This isn't the safest way, but used outside and away from sparks and flames it should be ok. A better way is to go down to your nearest auto parts place and ask for a liquid de-greaser. Do the immersion and soaking bit according to instructions on the can.

I would use any light-duty grease. The same auto parts house can probably recommend a light lubricant.

Try the "QRP Notebook" and "Solid State Circuits for the Radio Amateur",
both published by the ARRL. Lotsa interesting stuff in there. I'm planning
on trying my hand sometime soon at building a simple single-conversion
superhet that uses a 1-pole crystal filter in the IF section. (I think that
circuit is shown in the latter of the two books.)

Back in the war days, the enemy would over-run our comm outposts and we would lose all the equipment and write it off. Later, the good guys would over-run their comm outposts, and we would get our equipment back. Since it was already written off, it was brought back to someplace friendly (?) and placed in the botom of a hole and covered up with a bulldozer. We would then go over and dig up the pile looking for goodies. Within a years time, I had quite a few KWM-2As with all the accessories, etc.

What has this to do with cleaning capacitors? If you were put in a hole and covered up by a bulldozer, then uncovered some weeks later would you be very clean? Anyhow, off to the shop with our prizes. Take out the tubes and a few other frailties and into the mop sink full of good old hot water and dish soap. Today, I suppose something like Dawn which cuts grease real good would be OK. Slosh it around good and take it outside and hose 'er down for the rinse cycle. Hang it up by a chain outside and dry in the sun. A little shot of Lubriplate or your favorite greasy stuff in the bearings and your good to go.

I figure with all the scroungers in the shop, we must have done this to several dozen KWM-2As and bunches of other stuff. Never had any problems that I remember.

Good luck and 73,
Michael

We once got a whole fleet of GE Pre-Prog 450 MHz FM mobiles from a construction company. Those things were DIRTY!

Of all the methods that worked, the best one we found for cleaning them was to take all the tubes out and run the rest of the radio through the dishwasher. We'd stop it before it got to the DRY cycle, then take the radio out, shake the loose water out of it, blow it out with compressed air, and stick it in the kitchen oven (electric) at 130F for a couple of hours to bake dry.

Tuned them up and there it was. Never had a problem.

Motorola T-44s never survived that process. GEs didn't seem to mind.

I've been told that the RDF equipment used by the FAA requires a steady carrier such as provided by AM. While I'm sure that SSB would be more difficult to DF, it would seem that an FM "dead" carrier would suffice. I believe that the primary issues are that AM was first and the benefit of changing over to FM is less than the cost of the changeover would be to worldwide general aviation. There are still a lot of DC3s and even a few Ford Trimotors in service worldwide, not to mention the thousands of general aviation light planes and backwoods airports that would be forced to convert from a service that works to a service that might work a little better. Plus there is a strong feeling of "if it's not broke, don't fix it".

> mike ke8yy medelma@cms.cc.wayne.edu medelma@waynest1

Aluminum foil and plate glass work fine. Leave about an inch per 10kv of glass sticking out beyond the aluminum foil plates. Cut the foil with a tab sticking out for connection. Stack the plates with the tabs alternating on opposite sides of the stack. Bus the tabs together on each side. This makes a fine, cheap high voltage capacitor. Seal the edges with RTV. Mount the whole assembly on plexiglass bars well away from metal.

It's hard to beat a gas thyratron tube for generating high voltage pulses. Your pulse network should switch on the primary side of the last stepup transformer for best results. It is difficult to obtain a stepup transformer with better than 20kv primary to secondary insulation so switching the primary at as high a voltage as possible is a good idea. Isolate the core of the stepup transformer from ground with plexiglass mounting plates. Use a standard high vacuum glass diode for your flyback diode. Isolate filament supplies from ground.

Enclose the entire assembly in a LARGE Faraday shield. Stand well back when powering this monster up.

As long as we are reminiscing about old stories involving hams, does
anyone remember a Comic book called Treasure Chest that was distributed
by subscription thru elementary schools?? It may have been limited to
parochial schools, not having attended public schools, I can't say if
they got it too.

One of the stories was called "Chuck White". Chuck being the hero of
the story was a guy who took time to help out the various kids in the
stories. He was also a ham. One of the plots back in the mid 60s
involved a bunch of the kids trapped at a ski lodge by a blizzard and
the young hero (whose name I forget) uses what he learned from ham
Chuck White to take a car radio (tube type, this is the 60s) and the
batteries out of the cars and builds a transmitter out of it. (Yes,
it was CW, but then it was the 60s.)
All in all, it was a great story. Unfortunately, I don't know of
anyone who decided to become a ham after reading it.

So, are there any other OF's out there who remember it??

>Could you post or E-mail me information about the mods you did to MFJ-1270
>TNCs? I have had some problems with my 1274 (same thing with LED display) that
>your mods may fix or improve on.

I don't have my mods docs handy but here it is from memory. The first change is to replace the LM324 opamp that simulates RS232 with a TL084. The slewrate of the original part won't reliably work above 2400 baud. Cut the trace between the baudrate switch pin 1 and U1 pin 2, add a wire from the baudrate switch pin 1 and U1 pin 10. This turns the 300 baud switch position into a 19.2kb switch. This will allow a decent baudrate between the computer and the TNC.

Remove the MF10 filter chip and discard it. Remove the component header and discard it. Use a 1000pf capacitor to couple the audio directly to the PLL.

Install .1 uf tantalum bypasses on the solder side of the board directly from the Vcc pin of the 555 to ground and from the output rectifier to ground. This will despike the minus supply.

Increase the value of the PTT watchdog timer by paralleling the existing capacitor with another one of the same value. The current timeout is too short for maxframe 7 maxlen 255 transmissions.

We also goose the processor clock to 4.92 by changing jumper JMP2. On the MFJ you must cut the trace connecting pins 1 and 2 of JMP2 first. We replace the Z80 and SIO with B parts. We also upgrade the RAM speed and replace the ROM with a CMOS part.

Finally, install the TAPR DCD circuit board and you will have a really good TNC.

>How to degrease capacitor gears?

Use a vapor degreaser if one is available.

Gunk (tm) is an amazingly effective grease-dissolving substance
available in aerosol cans in K-Mart automotive departments. STP (tm)
makes a similar product. Spray it on, then wash it off with water (!).

Caution: Don't let Gunk get on electrical components. I used it on a
car engine, and it penetrated and shorted the oil-pressure switch.

>What is good for relubricating the mechanisms?

I've used white silicone grease available at dive shops; it's intended
for lubricating O-rings in underwater equipment. It doesn't dry out
like whatever they used to lubricate capacitor gears in World War II.

Just yesterday, I attended a talk by Jerry Kowolsky, the president of
CSI Technologies. They make high voltage capacitors.

Even though, I'm an EE, I never understood the difficulties of making
high voltage caps. Apparently it is quite an art. He indicated that
only about 5 companies in the world can produce 'good' ones.

His company got a letter like yours from Iraq about 2 years ago. The
rest is history.

I just took my novice test... AN PASSED!

1) Yes, I took the 5 wpm code test, without gimmicks, and passed.
- I listened to the code tapes that come with Tune In The World
for 20 minutes per day for two weeks.. This was *all* I did, and
was obviously all I needed.

2) I think the no code debate is a crock of <insert noun here>.

I actually *enjoyed* learning the code! It wasn't hard. As a matter
of fact, it was easy. Regardless of the fights against the code requirement,
I do not believe that 5 wpm is a difficult requirement whatsoever.

From: elmore@virga.ucar.edu
Message-ID: <8611@ncar.ucar.edu>
Source record: 8188

Hmmm... If I remember right, there are data on HF propagation effects of nuclear atmospheric bursts. Back when us and everybody else detonated nuclear devices in the atmosphere, radio propagation anomalies were at least noted and probably studied. Although all the info I have is second hand, I understand that disruptions occurred with every detonation and lasted a few hours.

Aside from the environmental and moral implications of using nuclear weapons, they present the worst kind of ionospheric disturbance. Someone correct me if I'm wrong here, but there are two basic kinds of HF propagation disturbances: increased absorbtion and turbulent disruption (like convective mixing). Increased absorbtion comes about when the atmosphere is bombarded with lots of high energy X-rays that lead to heavy ionization of the E and D layers; it can even give rise to a C-layer, any significant absorbtion by a C-layer is rare. Nukes provide such radiation in abundance.

Turbulence basically disrupts the surface of the reflecting layers, much like throwing a stone into a pond disturbs reflections from the surface. In this case, short wavelengths aren't reflected well, as the ionosphere presents a very rough surface to those wavelengths. This kind of disturbance can occur if there is a rapid increase in UV flux from the Sun. In that case, the lower ionosphere is heated too quickly, causing convective overturning and siruption of the layered structure we all know about. Magnetic storms can cause the same thing due to large changes in the electric currents that flow in the ionosphere.

In the first case, long wavelengths are readily absorbed and so quickly attenuated. In the latter case, short wavelengths aren't reflected well while long wavelengths aren't as strongly affected. A nuclear device will cause both affects to occur simultaneously. During a magnetic storm (or a big UV flare) long wavelengths do well and communications move to lower frequencies. During X-ray flares, long wavelengths are affected, and communications move to higher frequencies. In the worst case (major storms) long wavelengths are useless due to absorbtion and short wavelengths are useless due to turbulence. The magnetic disturbances from a nuke are noted world-wide, while the radiation effects are localized. Thus a nuke will resemble a SID (sudden ionospheric disturbance) with some diabolical twists.

So, hypothetically, what bands come back first (assuming anyone is around to care) will depend on where I am in relation to the detonation. Far from the burst, it may well be that the low-bands are only marginally affected while close in there will be a total blackout. Depending on how long the low-altitude ionization lasts, it may be the limiting factor in communications. What I might notice is a narrow window of frequencies open up as the MUF

slowly rises above the LUF.

It's all perfectly gruesome, but at least it may lend insight into
how the ionosphere works.

Kim Elmore (N5OP)

1483. Walker Tompkins K6ATX stories (Was Have you read...?)

Newsgroup: rec.ham-radio
Date: 1990-09-26 21:53:39 UTC
From: rlwest@flopn2.csc.ti.com
Message-ID: <9009262153.AA00285@tilde>
Source record: 8198

I ran across some of the WALKER (not Walter) TOMPKINS (not Thompson) books in a used bookstore a few years ago. These were the 1960's reprints.

I had previously noticed them in the ARRL Book ads.

When I glanced through them I really got "hooked," not by brilliant writing or really spell-binding mysteries, which they are not. But they are decently written, the stories are OK for a juvenile level (the intended audience) and the characters' personalities and mannerisms were simple but basic to the story. They were just enough under caricture to be almost believable. (I mean, I've known people like some of these guys!)

One thing stands out: K6ATX loved ham radio. That shone through strongly and impressed me to make a point of buying a full set from the ARRL booth at the next hamfest. (They sit on the shelf next to my Tom Swift Jr. collection!)

(NOTE: K6ATX was also the callsign given to the hero Tommy Rockford.
A postscript mentions that all the calls used were real, and were used
with the knowledge and consent of both the call holders and the FCC.)

The stories were updated in later printings. In the older edition, Tommy was using a DX-100, and in the later printing of the same story, he had a more contemporary Heathkit transceiver.

I read the news of Walker Tompkins' death just after reading the last K6ATX novel, "Murder by QRM". I was saddened that there would be no further stories.

I recommend that you check the local library or ask a friend... like I say, not pullet surprise literature, but most hams will identify with it.

I'd be curious of the reactions of "modern" kids. Would they consider it corny? Maybe, and maybe they're right. But the feeling for ham radio is there. How corny is that?

:-)

If any of you out there have teenage or pre-teen kids, how about giving it a try and letting the net know...?

Cheers,
Bob WA8YCD

You don't say how high the lines are. The higher they are, the more voltage (and noise) they have. Some of the noise may be caused by leaky insulators - some direction-finding and a call to the power company will clear that up.

Another consideration is where the lines are with respect to your favorite DX. If you can put the power lines to the back of a beam, you might be surprised.

A dipole is a pretty cheap way to find out what the noise level really is. Just string one along the roof and check the noise level with a friend's modern transceiver, with the noise blanking on. You can orient a horizontal dipole parallel and perpendicular to the power lines to simulate what a beam antenna would be like.

I live next to a fairly busy street, and get ignition noise from passing cars, so I can commiserate with your situation. Good luck in your investigation, hope it works out.

There are now a total of six of this series by Tompkins (before he became Silent Key in trhe past couple of years). There is a new series by a younger author (Wall) with one book so far.

All seven of these books are available from the ARRL at hamfests or by mail. See QST, October 1990, p. 167 for a list of books, prices, and order information.

They are NOT big sellers, I believe, but superior to some of the drivel I've seen ADULTS reading recently.

>in those other spots as well.

Ah, yes, the cryptogram method. I recommend it to anyone that has absolutely no intention of ever using CW.

One way to memorize the letters is by creating a binary tree, assigning "dit" to the 0-side, and "dah" to the 1-side. Assign each node the code letter generated when traversing from the root to that node. Finally, make up a silly saying based on all the letters produced, like "Extra Terrestrials In The New Mexico Sun Usually Require Water for DrinKinG".

Again, this is for those people who have ABSOLUTELY NO INTENTION of ever being CW-literate.

Re: any tricks for 13 WPM ?

None, other than practice until you have 10 wpm solid, then go to every test you can find until you get lucky. I got lucky, because one of the written test had a direct quote from the code test. I was able to fill in enough to get my one minute "solid" copy. (BTW, I now copy 15 WPM, and am trying for 20. Like mountains, we take on obstacles because they are there.)

>triggered spark gap switch using a trigger transformer...

I don't understand the application. By "fast" do you mean "no bounce" ?
You'll probably have to fabricate this from some relay contacts and a
large spring. One other possibility is using an arc gap as a switch.

1492. RDZ receiving equipment

Newsgroup: rec.ham-radio
Date: 1990-09-27 02:42:18 UTC
From: crisp@mips.COM
Message-ID: <41769@mips.mips.COM>
Source record: 8202
Cross-posted to: rec.radio.shortwave,rec.ham-radio

I recently came across a set of crystals for
"Model R D Z receiving equipment". These are a bunch of
crystals in a nice metal case whose frequencies range from
5185.42KHz to 6326.56KHz. Each crystal is marked with
a notation like "RDZ233.8" which for example corresponds
to 5185.42KHz. The RDZ notation would seem to be some sort
of code for the frequencies of the crystals. There is a
paper chart inside the case with all the frequencies and RDZ codes
for the crystals enclosed. This list is marked "Restricted"
and the unit was made for the U.S. Navy. Most of the crystals
also have an ink marking such as 9/53 or 11/53 etc. I would
assume these are the dates the crystals were made.

Does anyone out there know anything about the gear these were
used in?

Uh, almost...There was one story with a new kid with the call WV7XNN...the WV7 prefix would be kosher, but the XNN suffix is a no-no.
(WV-prefixes were used when it was necessary to distinguish those Novices destined for Ws from those destined for WAs after they upgraded.)

1495. AMSAT DSP Project Board For Sale

Newsgroup: rec.ham-radio
Date: 1990-09-27 04:49:19 UTC
From: COLE@BABETTE.ISI.EDU
Message-ID: <654410959.0.COLE@babette.isi.edu>
Source record: 8205

Remember the AMSAT DSP Project? As part of the project, Tom Clark negotiated a package deal on a bunch of Dalanco Spry DSP boards for the project members to use. Being a DSP nut, I chipped in and bought one. Shortly thereafter Tom and Bob (N4HY) fell down the Microsat hole and have not been seen since (just kidding).

I just upgraded my PC, and the Dalanco Spry board won't fit in the new 386 motherboard, which has no true 8-bit slots. Therefore I'd like to sell it.

The board is the Dalanco Spry Model 10, which is based on the TMS 32010 chip. The boards we got were the higher-speed 25 MHz clock version. I replaced the original hand-picked 320 chip with a GI (now Microchip) CMOS 320C10 rated to run at 26 MHz. The board has 4K x 16 bits of dual-port RAM and 40 K sample/sec A/D and D/A converters (12-bit, I think). Bob, Tom, and some other people put together a package of development software tools and some other neat stuff, including several different modems, an audio spectrum analyzer, etc.

The one caveat is that the board ONLY fits in an 8-bit slot, because of its physical outline. It should work fine with any PC or clone that runs the bus at standard rates.

Original cost was close to $1000, and we paid just over half that. I'll part with mine for somewhat less. Of course, the associated software, manual, etc., is included.

If you're interested please EMail me directly or call me during West Coast working hours at 213/450-9111, x2628.

Okay here's one for all you audio repair hackers out there.
I inherited an old solid-state stereo receiver the other day
which contains some dead audio preamp chips labeled SK9426.
I can't find them in the IC Master so I assume they are somewhat
rare/obsolete. Anybody ever heard of such a chip? Mucho thanks.

From actual experience I find that the interfering signal (defined as the
one that LOOSES in a "double") has to be at least about 15db weaker to allow
the other signal to be copyable.

> In your local police example, the various officers are almost

The reaction of AM to interference is linear. The reaction of FM is
non-linear and varies with the modulation index.

Compandored AM could be an interesting mode to try.

The Illinois Vehicle Code has a law in it that requires you to notify
the authorities "by the fastest means possible" in the event of an
accident resulting in injury. I suspect it might only apply if you
are or were in and/or operating a vehicle. I don't have the code book
with me or I would cite code and verse. I may do that later on.

My personal interpretation of this law is this. If I have my radio
with me and it can communicate with the authorities, then IS is THE
fastest means possible.

What I have not determined yet is what I will say and the operating
procedure I will use. I listen on there a lot and am already familiar
with how they operate, so I believe I could fit in FUNCTIONALLY, at
least in my hometown area. In addition, as a volunteer (storm spotter)
for the county ESDA (Emergency Services and Disaster Agency) I have a
radio ID already we use on storm spotting on the ESDA frequencies.
The dispatchers do at times talk to a few other ESDA people using their
ESDA ids on the ESDA frequencies and once even on a NON-ESDA frequency,
so I believe if I used my ESDA id when calling the dispatcher, they would
have a functional handle to work from. Will they believe me? If I was
going to pull a prank, I could call 911 from a pay phone, and I have heard
them send fire engines out to prank reports before and they were even sure
it was a prank. Better safe than sorry. The radio and the phone calls
are all recorded, so my voice would be on tape either way. If I am
questioned as to the appropriateness of the use of the radio I can
certainly cite the Vehicle Code. Whether or not the use of my ESDA is
would be considered appropriate in such a case, my only defense would
be that "it was an identification the dispatcher could immediately deal
with".

I would followup any such use of the radio with a written report to the
appropriate authorities so they would know exactly "what, when, and why"

of the incident. Only after that will I be able to REALLY find out how they react to such use of their radio frequency. Being in ESDA has a slight advantage in this case as well, I believe.

I believe the UHF and higher bands will come back first. I would expect the HF band to be totally absorbed for a good while (but not days) after the blast. The cummulative effect of a multitude of blasts could cause some major (and maybe long term) radio blackouts and/or some wierd and unexpected propogation modes.

This all assumes you live.

I rarely answer questions that start as illiterately as 'Okay' but....

The reason you didn't find the SK9426 in the IC master is that it's not
an IC. It's a matched dual PNP transistor with common emitter leads,
intended for use in differential-amplifier circuits.

An NTE-43 is one substitute; check with your local tv repair parts shop
to see if they have some.

A note of caution: the SK series is/was RCA's "universal replacement"
line of parts, just as the NTE parts are. Those parts were rarely used
in new production (unless it's a homebrew) so you have to consider:

1) the unit you've got has probably been fried and worked on before

2) you're trying to find a substitute for a substitute, so there's no
guarantee that the third-hand part is going to work at all well.

Enjoy.

>

About 11 years ago I was driving on a country road in the hills along the border of east Tennessee and North Carolina. I came around a bend, and suspended over the road was some real rickety looking open wire line, draped over some homemade supports lashed to trees and fence posts. Looked like something from an old Gil cartoon in QST.

I looked up the hill to my left, and the line continued up to an old weather-torn TV antenna on a short homemade mast. I looked to my right over the cliff, and the line continued on down into a ravine, where it ran along a fence, with open wire feeders tapping off and running into several little shacks.

It was a hillbilly CATV system!

From: PJML@ibma.nerc-wallingford.ac.uk
Message-ID: <27.Sep.90.12
Source record: 8221

I have had fair success cleaning capacitors by using an ultrasonic cleaning bath and dishwashing detergent.
A period of 4 or 5 hours of being bombarded with ultrasound shifts all the old grease, oxide, dust from between the plates etc. and brings the ceramic stator insulators up like new. The same treatment can be used for bandswitches , tube-sockets, open-type volume controls, and roller-coasters.
Note i would caution against using organic solvents with some components; these solvents can dissolve or distort plastic parts. Phenolics in particular behave very strangely. I have lost a number of tube bases this way..!
After cleaning, wash thoroughly in fresh water, and dry in an oven (to make sure all the moisture is driven out of the ceramic parts...) the re-lubricate the bearings with light machine-oil. Do not over-lubricate, since the oil will attract dust.

This treatment can make avast improvement to a 'drifty' VFO. I gave the tuning capacitor of my AR88 just such a washing, and the stability was much better afterwards.
Take care to avoid damaging the capacitor plates though, or you will probably mess up the dial calibration or tracking.

>be a high priority action item in the 2 hour war scenario.

According to the results of research performed by SRI in the
50's, from the time of a (large) nuclear detonation until
many hours (days ?) afterwards, HF propagation is essentially
non-existent. So, HF ham radio and in fact all HF communications
will be temporarily " canceled" by fiat in the event of a nuclear
war.

Also, do you see that Yamaguchi Mach V transceiver there on your
desk ? If people start exploding nuclear bombs, it will most
likely become a $1K paperweight due to EMP effects.

1507. Query Regarding Facsimile Protocols/Standards

Newsgroup: rec.ham-radio
Date: 1990-09-27 15:50:00 UTC
From: nix%muppet.decnet@CONSRT.ROK.COM
Message-ID: <9009271452.AA08671@ucsd.edu>
Source record: 8216

Can anyone shed some light on the technical standards that facsimile machines follow? Another engineer in my office is looking to buy one, and he started asking me questions about fax protocols; I didn't have the answers.

We figure that the "G2" and "G3" designators, that the fax manufacturers are so happy to sprinkle throughout their spec-sheets, must be referenced in some CCITT document.

A `buzz-word' query; is a "pel" another way of saying pixel (picture element)?

A Canon fax spec-sheet inferred that a "G3" compatible machine could run at several different speeds (starting at 9600 baud, and working at 3 or 4 lower speeds; bottoming-out at 2400 baud).

From that, I would infer that the "G3" (or "G2" I suppose) protocol must define the way in which a document is scanned (number of lines per inch; number of pixels per line; modulation technique; start-stop-control characters), while leaving the question of transmission rate still a variable.

Comments would be appreciated.

Thanks,

Paul Nix (WB5AGF) InterNet: nix%muppet.decnet@consrt.rok.com

I call it "cable ladder for squirrels." Open-wire line has low loss
and is inexpensive. It works well for people who live in deep valleys
and must run long lines to TV antennas on mountaintops. Satellite
dishes have replaced a lot of open-wire TV line in Appalachia, but
some very elaborate systems are still in use. Sometimes they string
the line across valleys, hundreds of feet above ground. A helicopter
pilot for an Eastern Kentucky coal company told me that he doesn't
like to fly below the mountaintops because of that stuff.

Just in case nobody knows any more,

About 25 years ago, a MARS-connected radio club had a TDZ/RDZ pair in their clubhouse. That's the only ones I've seen. RDZ was the receiver and TDZ the transmitter, of course. These were BIG rack-mounted HF (?) gear. Of particular note was the motor tuning. You pre-programmed them with all the front panel knob settings (lots of 'em) and when you switched channels, motors turned the knobs to the right position. Sort of the ancient equivalent of today's no-tune radios.

I think they were AM gear, probably using 2C39s, 4X150s, or some such finals in the TDZ. Brings back memories. Anybody have an old Fair Radio catalog?

Message-ID: <9009272015.AA10219@tilde>
Source record: 8077

In rtodd@thoreau.nsc.com (=Ron Todd), Ron Todd says

>Having not done any quantative work on these systems I wonder:

Well, I had to go way back about 40 years for documentation on this one,
to my notes from "Conversations with Dad".

1) Do they work better with a button on the end of the string
or is knotted string better.

A knot (must be fairly large) works with waxed cups. However, the low-
frequency response is better when you use half a popsicle stick. The
capacity created by the larger surface area of the popsicle stick does
a better job of passing the low frequencies than does knots, round sticks
or even buttons.

>2) How much improvment does the wax make.

The string to use is cotton twine, however it does have a very low velocity
factor. Thoroughly waxing the string makes about 3 magnitudes increase in
Vf. In fact, beeswax is suspected of increasing the linear admittance better
any other material.

>3) What is the attenuation per unit distance vs string
thickness/material.

No measurements were recorded in my notes, but a calculated approximation
may be had by squaring the summation of voice frequencies present and div-
iding by the product of the mean diameter of the string, plus the square
root of the coupling mode (button, stick or knot), and the result multiplied
by the third derivative of the waxing medium's goo factor.

>4) Is it necessary to match the cans or does a larger
can make a better transmitter or receiver.

It is not necessary to match the cans to effect a transfer of power. However,
an impedance mismatch can occur due to the different resonant frequencies
of dissimilar-sized cans. This mismatch can create large standing waves of
sound on the string at a particular frequency. If the frequency at which
the standing wave occurs is sufficiently low, it may cause premature failure
of the string. You must consult a Jones Chart to find the frequencies at
which failures can be expected to occur.

>5) How well does an oatmeal box do compared to a coffee can.

My notes indicate that serious testing was conducted using various transceptors.
Coffee cans (the metal kind) fared poorly in both response and volume. Far
better were the waxed drinking cups and Quaker Oats "boxes". The choice between

the two is simply a matter of preference. Those who like boomy bass would prefer the Q. O. box, while people who like crisp ambience and 1/2 inch speaker cables may prefer the waxed d. c. No experimentation was done with plastic containers, since these had not been invented at the time the study was conducted.

>6) Are the "synthetic" material cans any good, how about
the composite cans.

This question was answered in 5) above.

>7) Are aluminium cans better than steel.

No comparisons were made on these materials.

>8) What effect does string tension have.

Itzhak Perlman might say that string tension is the single most important factor in this design. The tension factor can be thought of as a steep-skirted bandpass filter; optimum tension is that which barely avoids coupling pullout. As tension is relaxed, the string impedance increases rapidly and capacitance to earth builds so that frequency response shifts quickly to the low end, then suddenly communication becomes impossible. This point is called the critical-laxity factor, cLf. If tension is increased beyond the optimum, frequency response of the system shifts toward the high end until the string impedance reaches infinity due to fiber failure. This point is the critical fiber factor, cFf.

If the coupling mode is a knot, coupling pullout may be reached long before cFf. In fact, it is possible for the optimum tension to occur just before coupling pullout. For all other coupling modes, the range of tension between cLf and cFf can be fairly narrow. Each system must be tested for its own innate characteristics may vary considerably from a seemingly identical one. Furthermore, operator training and experience is important in effecting reliable communication with these systems.

I wish to thank Ron for his well-thought-out, incisive questions.

73, and good canning!

Source record: 8081

In article <7880294@hpfcdc.HP.COM>, perry@hpfcdc.HP.COM (Perry Scott) writes:
> Anybody care to venture a guess what transmission mode will be most
> successful just after the initial EMP ? No... It couldn't be ... HF
> CW ? Gak. That's even scarier than The Bomb itself.

The following is from
Nuclear Battlefields, Global Links in the Arms Race
by William M. Arkin and Richard W. Fieldhouse,
Ballinger Publishing, 1985

Page 31

"The military endlessly studies the effects of nuclear blasts on communications [nuclear "blackout"] and has spawned numerous programs to provide the new "endurance" requirements of a long-term nuclear war. "Following a nuclear exchange", one miltary consultant has stated, "mobile [or proliferated] HF may well be the only long-haul communication resource that will survive intact" [G. Wetmore, "HF Radio: a Major Asset for 'Enduring C^3', Journal of Defense Electronics, May/June 1981] But HF is not the only frequency being examined. Groundwave communications are only moderately affected by nuclear explosions in the atmosphere. The military is examining VLF and LF frequencies because they are reliable, can penetrate sea water, and have relatively good performance in a nuclear-disturbed environment.
The key "enduring system is the Ground Wave Emergency Network [or GWEN]. GWEN will be a grid of 300 foot [tower height] unmanned relay stations, with EMP hardened LF transmitters and receivers. By transmitting "groundwaves", the radio signals will follow the earth's surface and will continue to functions in spite of the nuclear disruption of the ionosphere."

From Monitoring Times, August 1988, The "below 500 kHz" column.

The GWEN stations have been heard recently, after what was a fairly lengthy, rather quiet period. These send "packet radio" which requires special equipment to decipher or make sense of. With ordinary receivers, the sound can almost be described as hearing a couple of guys coughing. If you hear some unusual sounds in the 150-175 kHz area, it may well be some of the GWEN stations in operation. Information about them seems to be limited, as these are classified data.

Back to Nuclear Battlefields, Page 33.

"Another communications medium for use in nuclear war is "meteor burst communications" [MBC]. ... Billions of ionized meteor trails, constantly present in the atmosphere, can be used to reflect VHF radio signals. Due to the enormous amount of debris, and the wonders of modern technology, communications at the rate of 100 words per

minute over distances of 1,200 miles can be reflected off the meteor trails. ... Since ionization would increase in a nuclear war, and thus enhance MBC communications, MBC plays a prominent role in the official fantasies of the post-attack communications. "

{So if you want to emulate the government after a nuclear war try either the Lowfer band (160-190 kHz) (Part 15) or 6 meter meteor scatter packet radio.}

1514. HT prices & survey

Newsgroup: rec.ham-radio
Date: 1990-09-27 22:09:43 UTC
From: goris@hpfcdj.HP.COM
Message-ID: <18230039@hpfcdj.HP.COM>
Source record: 8217

I'm in the market for an HT, but I think I only need 2M. I'm interested in peoples pro's and cons for the Icom 2-SAT, 2-GAT, Yaesu FT-411E, and any other model they think is worth while. In fact, why don't I just conduct a little survey here, and I'll post the results. If someone has already done this recently, could you please mail me the results? thanks.

The survey:

1. What is your favorite single-band (2M) HT and why?

2. What features do you think are important in a 2M HT? (e.g., obviously DTMF, but what about # channels, sub-audible encode/decode, clock, etc.?)

3. What antenna's do you recommend for it and why?

4. What batteries do you recommend for it and why?

5. Are there any other accessories you recommend?

6. Is there any dealer you would recommend or not recommend?

I realize a lot depends on how much you want to spend, what you want to do with it, etc., but I'ld still like to hear people's opinions to these open-ended questions.

Since I'm asking for so much data, I thought I'ld offer a little in return. I called around for prices on a couple of HTs, and here's what I found out:

HT Prices Surveyed On 9/27/90

May/90 QST page			Icom IC-2SAT	Icom IC2-GAT	Yaesu FT-411E
184	Reno Radio	800-345-5686	$315	$365	$335
192	Missouri Radio Center	800-821-7323	329 A	365	335
176	Jun's Electronics	800-882-1343	315	375	349
159	Austin Amateur Radio	800-423-2604	349	359	329
150	Madisson Shopper	800-231-3057	---	365	329
120	Barry Electronics	212-925-7000	370	270	340
109	R&L Electronics	800-221-7735	349 B	369	339
107	Amatuer Electronic s.	800-558-0411	360	380	340
100	C-Comm	800-426-6528	349 C	369	339
94	Ham Radio Outlet	800-854-6046	359 D	379	339

Notes

A. 2nd battery for 1/2 price. bp82 $22.50,bp84 $37.00,bp85 $49.50, bc-72A charger $104.

B. Free bp81 or bp82 (300 ma-hr) + 1/2 off any battery; bp84 $33.

C. Sub-audible encode/decode costs $45.00

D. bp-84 $75.00, bc-72 $100.

Since I'm new to this, I didn't think to ask for battery prices until I'ld already called most of the dealers....

1517. Re: Hand held radios on airlines

Newsgroup: rec.ham-radio
Date: 1990-09-28 03:46:09 UTC
From: dale@sequent.uucp
Message-ID: <43146@sequent.UUCP>
Source record: 8079

I just returned from an airline trip, and took my 2 M HT. I made
the trip with a single carry on bag, had the HT wrapped in some
clothes for padding with the antenna in another compartment.
This is an ICOM 02AT clone, same size as the ICOM and had an
8 cell battery pack. Also in my bag: 12 extra AA batteries,
electric razor, small travel iron, car keys, some change,
(those are the metal items) also a couple books and my clothes.

All flights were on United. At Portland, Oregon the bag went
through X ray and nothing was said. In Indianapolis they wanted
to see the travel iron, also asked if I had batteries in there.
I showed them the travel iron, and asked if they wanted to see
the radio. Response was "No, we could see that", meaning that
it showed up on the X ray.

However coming back through Denver a woman said she needed to check
the bag and proceeded to open it and completely scramble the
contents. She was pawing through it making a *real* mess of
everything. She pulled out my shaving kit and the travel iron
and then sent the bag back through the X ray. Once again she opened
the bag and started pawing through the contents after the
"big metal thing". It was still wrapped up so I unwrapped it.
She took it and held it up for the machine operator to see, and
then gave it to me and walked back to the machine.

So, it is OK to take handhelds on the airlines, no one ever even
said not to use it on the plane (I didn't use it nor ask if I could).
The thing I learned is to be careful about letting them search
the bags. This was a business trip, and I started out with
shirts and ties very neatly folded. I'm lucky the search was
at the end of the trip, else I would have had very wrinkled
clothing (guess the travel iron would have been of use then :-).

BTW: Does anyone own a Santec ST-20T? I need a copy of the
owner's manual.

1518. QSOs by appointment?

Newsgroup: rec.ham-radio
Date: 1990-09-28 04:00:56 UTC
From: julian@bongo.UUCP
Message-ID: <251@bongo.UUCP>
Source record: 8222

I decided to spend the evening reading some trash, there are only so many computer manuals anyone can digest, and being fresh out of bodice rippers, I grabbed the October QST.

On page 14 was "The Club Bouvet, 3Y5X, Story". I usually expect the "How we worked the States from a coral reef" stories to be in CQ, but it seemed like good light reading so I gave it a go.

I noticed on Page 15 that on of the picture captions said: "...The PC is used to log contacts and communicate via Inmarsat." I wondered why, they had a boat offshore, which according to the story had full Nav and Comms. Why, with all that Amateur Radio gear around on this storm lashed piece of rock do they need to chopper in an Inmarsat terminal? Must be so they can assure the XYLs at home that they are eating well and sending out their laundry.

I turned the page and read on with this story about how to spend $330,000 on a trip to an island that not even penguins are too happy about calling home. So half way down column one on page 16 is one of those amazing coincidences that makes life so worth while: "After more than 25 hours of hard labour, punctuated by only a few hours of sleep, we were quite exhausted. Happy and ready for the DX operation, we moved up to 14.145 MHz and Einar worked LA6VM as the first station."

Absolutely bloody amazing, I suppose LA6VM had been crouched by the rig, amphetamines in hand, for days waiting for a peep from his Norgie chums in the South Atlantic. But read on, in the next column is more riveting ham radio news: "The new Inmarsat satellite system was impressive, providing two-way public TELEX service from our laptop computer via a tiny omnidirectional antenna for weather reports, press releases and other project correspondence. We also had an HF voice link to Norway on frequencies outside the ham bands."

Only a cynic would envision a scenario where an exchange is made via Inmarsat to schedule a CW QSO on 20 Meters. Amazing where technology has taken us.

I assume all the CW gear was to back up the Inmarsat terminal (-:

I have seen window glass and aluminum foil used on Tesla Coils.
Window glass has a dielectric constant of about 7 and a very
high puncture voltage. As I recall 7 is one of the higher
dielectric constants so it would take less plate area per
Ufd and therefore have less inductance than most other common
substances and the price is right.

Pete,
A small antenna is antithetical to high gain at VHF.
I don't know that you could put it up, but a wire rhombic can have
quite high gain. You can make one out of hookup wire but you'll need
to be able support it at four points at least 15' above the ground,
perhaps one support point could be your building.
I'll have to go verify the dimensions, but a high band TV rhombic about
35 feet across the narrow way (orthogonal to direction of station) and
120 feet the long way, terminated at the far end can be fed with
300 ohm twinlead and perform better than the best commercial antenna
you can buy.
I think the question is wheter you could get the powers-that-be to
let you install a wire rhombus of that size...
Let me know if you need more detail, I have some numbers around here
somewhere (as well as a Collins radio paper on rhombics from the '50s).

Somebody asked about a mod for 2sat that will allow receive 108-140MHZ AM and other freq. To unlock VFO, turn set off. Press and hold simultaneously (at the same time) #, B, and light keys. TUrn set on and hold these keys for three or four seconds. You will get all kinds of stuff on display, but after all settles down, your VFO will be unlocked and you get:
108-140MHZ AM, 138-169MHZ FM and 310-370MHZ FM. These for sure, maybe more.
THis is receive only. Good Luck.

> 1) What is the legal limit of wattage or whatever a person
> can broadcast at without an FCC license?

My recollection is 100 mW (that's MILLIwatts) DC input; there are also,
I believe, restrictions on antenna length and height. The overall result
is that you'll be very lucky to get a range of more than a couple of hundred
feet or so to most broadcast receivers.

> 2) Does anyone know where I can find schematics and plans
> to do this?

There are a number of simple "AM transmitter" construction projects in
hobbyist-type books; check at your local library or Radio Shack. (RS used
to have a kit for an AM transmitter, as well as for an FM "wireless mike").
However, please keep in mind that the restrictions are such that any
license-free setup will be little more than a toy; you certainly can't
build a "real" station - meaning one with any meaningful coverage at all -
without an FCC license, and the requirements for a broadcast license are such
that it is VERY unlikely that an individual could build a licensable station
as a "home project." And if, with that said, you're tempted to set up as a
"pirate" station...well, the FCC has a remarkable lack of a sense of humor
about such things, and rightly so.

About the only way that a "broadcast" outlet can be set up *relatively*
cheaply and hassle-free is the "carrier-current" type of station, as used
by many college dormitories. This arrangement basically uses the building's
AC wiring to carry a low-level signal, which again is very unlikely to make
it very far outside the building.

Notice how Mike's sentence starts with the word "I". His point was to relate his personal experience. Lighten up - it wasn't aimed to belittle you. The way to get NO-CODE is through comprimise and reasonable thought, it is *NOT* to try to make those who learned and enjoyed CW feel guilty about it.

What does "difficult" mean to YOU? You want to be able to do it in 10 minutes? Ptpth. Most people are perfectly capable of learning CW. It takes time and effort, too. The new changes in testing procedures for the handicapped encourage it. Try arguing about whether or not it is NECESSARY to have CW tests; that's a little more to the point.

At first I was going to suggest one of the el-cheapo 567 detectors that was
in the ham magazines in the late 1970s, until I read:

>
> I would prefer one that translates to ASCII, but I will
> look at anything that doesn't require my CPU to poll a
> line for transitions.

If you want one that puts out ASCII, you need one of the multimode
controller boxes, like the AEA PK232. This will do other modes (like
packet, AMTOR, Baudot, etc) too.

The problem is not that NASA "oversold" the shuttle program. (They did this, but it's not the biggest problem.) The real problem is that NASA has not received sufficient funding since the days of Apollo. They had no choice but to develop as cheap a manned space vehicle as possible. The U.S. government, and the American people, expect a turbo-Porsche from NASA but are only willing to pay for a Yugo. As it is, NASA has received funding for a Yugo but at least have produced a Chevy. Chevys break down a lot, but they work.

We should be thankful for what we've gotten from NASA, considering the low funding they've received. I remember when Reagan told NASA that "the shuttle program will have to pay for itself." This unreasonable demand forced the agency to schedule far too many shuttle missions in 1986, which is one of the biggest reasons why the Challenger was launched on that cold January morning.

I know that hams and the rest of the country are frustrated with the shuttle program right now, but in my opinion, the country is getting what it deserves.

1532. Re: Performance of QRP/homebrew transmitters and receivers

Newsgroup: rec.ham-radio
Date: 1990-09-28 19:47:42 UTC
From: randall@informix.com
Message-ID: <1990Sep28.194742.9216@informix.com>
Source record: 8099

It is quite fun to build your own QRP CW rig. I built a "Tuna Tin 2"
from the ARRL's "Weekend Projects" book and had a lot of fun with it.

However, I would not encourage new hams to do this. As an inexperienced
operator, you will become frustrated with your 1/2 watt signal. You won't
make many QSOs, you'll get frustrated, and then you might even give up the
hobby.

You are better off hunting down an old tube-type transmitter at a hamfest.
I started with a Drake TR4, and was quite happy with it until I sold it,
so I could buy an ICOM 735.

I would recommend Doug DeMaw's "Help for New Hams", which is sold by the
ARRL. Doug also wrote the article about the "Tuna Tin 2". His advice for
new HF hams is to run about 100 watts to start, and then to go to QRP
when you've gained experience.

1533. Improve the squelch in a Pro-2005

Newsgroup: rec.ham-radio
Date: 1990-09-29 00:41:35 UTC
From: dave@imax.com
Message-ID: <1990Sep29.004135.5994@imax.com>
Source record: 8094

In the past, Bob Parnass has posted instructions here for reducing squelch hysteresis for a variety of scanners (the article is titled "Improve the Squelch in your Monitor Receiver"). It included instructions for various Radio Shack scanners, but not the 2005. I've made the change to my 2005; here's the info for anyone else who'd like to do the same.

First the problem: the 2005's squelch has a considerable amount of hysteresis, so that once the scanner has "latched onto" a station, it will stay on-channel until the transmission has ended, even if the signal strength is varying. Unfortunately, if you set the squelch high enough so that it remains squelched on unused channels, the scanner will miss weak stations entirely. If you reduce the squelch control to receive the weak stations, the scanner will not scan - it stops on every channel.

Modifying the radio to reduce the squelch hysteresis allows very weak signals to trip the squelch - you can scan for weaker stations. The price you pay is that varying signal strength will cause the squelch to "pop" in and out, and the receiver may resume scanning in the midst of a call. Even if you set the squelch control higher to receive only stronger channels, they are still subject to popping - it's the change in strength that matters. By adjusting the value of the resistor that provides hysteresis, you can select any tradeoff between extra sensitivity and popping.

Next, the warning: The PRO-2005 uses mostly surface-mount components, which are considerably harder to work with than standard ones. If you haven't worked with surface-mount before, don't make this your first project. The resistors are held on the board both with solder and a small dab of glue, so this isn't going to be easy. I did OK with a temperature-controlled soldering iron, desoldering wick, and an X-acto knife; commercial equipment intended for working with surface mount parts would be better.

You should also obtain the service manual for the scanner - it will help you understand what is going on.

The basic info: If you've had your 2005 apart before, and are familiar with it, here's all you need to know: The squelch hysteresis is set by resistor R152, a 33 K-ohm resistor on the underside of the linear board, connected between pins 12 and 14 of IC2. IC2 is a TK10420, the 16-pin DIP closest to the front of the scanner on the linear board.

The original resistor is a so-called "0805"-series resistor - this means it's .080 by .050 inches in size. Replacing it with another

surface-mount part is neatest, but you can use a conventional 1/8-W resistor as well, and this is probably best if you're going to experiment with different values. I replaced my R152 with a 220 K resistor, and this gives somewhat too little hysteresis for my taste. You might want to try 150 K or 200K instead.

More detailed instructions: There are 3 main circuit boards in the scanner. The large one visible when the scanner's top is removed is the "linear" board. The smaller board revealed by removing the bottom cover is the "PLL" board. And the one behind the front panel is the "CPU" board. Major disassembly is required to get at R152:

- unplug scanner, remove backup battery

- remove top and bottom covers

- disconnect all connectors connecting the linear board to the two other boards, including 2 coax cables between PLL and linear board

- remove the front panel and its ground straps (6 screws). (If you want to change the configuration-setting diodes, this is the time to do it).

- it makes reassembly easier if you remove the PLL board at this point, though it isn't absolutely necessary

- remove all screws holding the linear board in place. There are 13:

- 2 holding the external antenna jack and attenuator switch subpanel to the rear panel
- 2 holding Q32 and IC8 to the frame for heatsinking
- 9 holding the PCB itself. One of these is *inside* the metal shield can that is nearest the scanner front

- unsolder power transformer and backup battery wires if you wish (not strictly necessary)

- if you did not remove the PLL board, pry up the front of the linear board until it disengages from the 4-pin connector on the PLL board that comes through a hole in the chassis

- pull the linear board forward to disengage the jacks from the rear of the chassis

- find IC2 (TK10420), the 16-pin DIP nearest the front of the board. R152 is below the body of IC2 on the other side of the board, connected between pins 12 and 14

- remove R152 with whatever means you have, then solder in the new resistor.

- reassemble in the reverse order, with the following notes:

-if you didn not remove the PLL board, use great care in re-installing the linear board to ensure that the 4-pin

connector joining the two boards aligns correctly. You may have to bend one side to make this happen.

- if you did remove the PLL board, re-install it after the linear board, and make sure the 4-pin connector lines up properly

- note that the screws that hold Q32 and IC8 are longer than those that hold the circuit board

As usual, this will visibly void the warrany of your scanner, so proceed carefully and don't break anything!

I recall that there was a satellite active a few years back called ats1.
This bird handled communications from scientists at the south pole back to
the us. The frequency used was around 136mhz. Is this bird still active? If
not, where are the communications from the pole taking place? I know that
other ats birds have been launched. Do they still use vhf 136mhz? Any infor-
mation would be appreciated.

1537. Re: Hand held radios on airlines

Newsgroup: rec.ham-radio
Date: 1990-09-29 04:41:31 UTC
From: johns@uhunix1.uhcc.Hawaii.Edu
Message-ID: <9610@uhccux.uhcc.Hawaii.Edu>
Source record: 8107

I gave the airline security guys a fright with my ham gear this summer.
Travelling from Honolulu to San Francisco, I had packed a 2 meter
handheld and a bunch of spare battery packs. Just for good measure
I threw in the wall charger and the speaker mic too, just stuffed
into a small box.

It must have looked like a standard Hollywood mad bomber device on the
X-ray scanner. Drew a crowd of security, until I told them that it was
just a bunch of radio parts.

The moral of the story is: pack neatly, and try not to carry a slew
of battery packs around. Besides, they are heavy!

> Hi; Anyone know if Thickwire Ethernet coax is any good as antenna feeder?
> Better or worse (or the same?) as CATV hardline??
>

First of all CATV hardline is 75 Ohms, The thick yellow Ethernet stuff is 50 Ohms. I would say that per 100 Meters the Heavy solid aluminium jacket CATV stuff has less loss than Ethernet cable.

But the question I would like answered myself is, how does the yellow jacketed thick Ethernet cable compare to RG8U? The RG8U cable is designed for outdoor use, we can assume that the designer yellow stuff is not. Now thin Ethernet cable is RG58u, plain and simple. So why the yellow stuff for thick cable?

My Belden catty (Master Catalog 885) Page 187 has Ethernet thick cable - Yes there is a plenum version available to keep the cranky building inspectors at bay. The specs say it is 50 Ohm. The insulation is Cellular Polyethylene (Foamed Teflon for the plenum stuff). The OD is 10.28 mm for regular and 9.53 mm for the plenum stuff. Now Belden 8214 (RG8/u type) has an OD of 10.29. These dimensions are to help those who would want to stuff the cable into a regular 50 Ohm N connector.

As this is Ethernet cable and it has recommended working distances, Belden don't bother to post the attenuation figures. My guess is that would be about the same as regular RG8. If you can get this stuff free and can live with the trendy yellow jacket, make the best of it.

Maybe someone else has the actual attenuation figures of this stuff. Maybe someone could also explain why not use RG8 for Ethernet cable. I don't know what the price difference between Ethernet cable and RG8 is. That alone may explain much.

>
>Gary KE4ZV

Gary, I'm very disturbed by your lack of thought concerning my posting.
In the beginning of my posting, I prefaced it with *I* ... These were *my*
feelings; I was not attempting to say that 'this is the way it is'.

You, on the other hand, displayed a true lack of 'brotherhood' in the
advancement of ham radio. Yes, I agree that certain people have trouble
learning the code. I maintain that in most of these cases, it is because
1) they choose to have a hard time at it by a lack of HONEST effort over
a period of time and 2) because people like you promote the attitude that
its silly and you don't need to learn it. "You can cheat your way through
this way: let me show you. "

I'm sorry you have had such a bad experience with CW. I tend to think
that CW is a necessary barrier of entry. I think of Ham Radio much the
same waay as music. (I have been a musician for 18 years.) Many people
want to be a musician and (for instance) play the guitar. Playing the guitar
takes several things: Time, desire, ambition, patience, diligence and
PRACTICE. If even one of these things is lacking, the person will not be
successful in learning the instrument. (By the way, there's no way to
cheat on a guitar test.) I submit that the same requirements exist for
learning the code for the ham radio tests.

Gary, I do hope that you can learn to further the efforts of ham radio
operators in a more respected manner than what you are displaying. It is
a worthy hobby of talented and willing individuals. Perhaps one of the
reason the code requirement exists is to keep out people who will be a
detriment to the radio community as a whole. (I bring to mind the recent
20 meter wars, and also leave you to think of the deplorable condition of

11 meters.)

I, personally, will continue with my enjoyment of CW and will more than gladly put forth the honest time and effort to speed up to 13 and even 20 WPM. It will be difficult, but after playing the acoustic guitar for over 16 years, I know what diligence is and how it pays off. While my primary use of the bands will be voice usage after I upgrade, I feel that CW is necessary. And, I hope that my mentor (I fear to call him an Elmer, his hair isn't grey enough! :-)) doesn't have such discouraging words as you do. Otherwise, I would probably abandon ham radio completely.

> What is wrong with the XNN suffix?

2x3 callsigns with suffixes beginning with X aren't used in the amateur service; they're reserved for Part 5 experimental stations. About 12 years ago or so, the FCC issued a bunch of WB5Xxx calls; they all were issued replacement licenses when the FCC realized their mistake. If you hear someone signing WB5Yxx, ask them...chances are that they got an X-call first.

I certainly don't have a problem with a DXpedition handing out the
first contact to someone who was a major force in making the trip
happen but who stayed home to coordinate things at that end. As you'll
notice from the article, LA6VM was one of the founders of Club Bouvet
as well as its QSL manager. He provided invaluable assistance in gathering
the funds and equipment necessary for this trip, as he did a few years
ago for the first-ever Peter I DXpedition.

I think having alternate comms capability with your support staff back
home is an excellent idea. I've heard DXpeditions trying to get
important information back to their families and ham assistants on 20m.
Sometimes they get interrupted (or jammed :-( ) by other people.

The Inmarsat idea sounds smart to me.

1546. NASA Prediction Bulletin Format

Newsgroup: rec.ham-radio
Date: 1990-09-29 17:12:55 UTC
From: tkelso@BLACKBIRD.AFIT.AF.MIL
Message-ID: <9009291712.AA28159@blackbird.afit.af.mil>
Source record: 8102

As a service to the satellite user community, the following description of the NASA Prediction Bulletin's two-line orbital element set format is uploaded to sci.space on a monthly basis. The most current orbital elements from the NASA Prediction Bulletins are carried on the Celestial BBS, (513) 427-0674, and are updated several times weekly. Documentation and tracking software are also available on this system. The Celestial BBS may be accessed 24 hours/day at 300, 1200, or 2400 baud using 8 data bits, 1 stop bit, no parity.

==========

Data for each satellite consists of three lines in the following format:

```
AAAAAAAAAAA
1 NNNNNU NNNNNAAA NNNNN.NNNNNNNN +.NNNNNNNN +NNNNN-N +NNNNN-N N NNNNN
2 NNNNN NNN.NNNN NNN.NNNN NNNNNNN NNN.NNNN NNN.NNNN NN.NNNNNNNNNNNNN
```

Line 1 is a eleven-character name.

Lines 2 and 3 are the standard Two-Line Orbital Element Set Format identical to that used by NASA and NORAD. The format description is:

```
Line 2
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
10-11 International Designator (Last two digits of launch year)
12-14 International Designator (Launch number of the year)
15-17 International Designator (Piece of launch)
19-20 Epoch Year (Last two digits of year)
21-32 Epoch (Julian Day and fractional portion of the day)
34-43 First Time Derivative of the Mean Motion
or Ballistic Coefficient (Depending on ephemeris type)
45-52 Second Time Derivative of Mean Motion (decimal point assumed;
blank if N/A)
54-61 BSTAR drag term if GP4 general perturbation theory was used.
Otherwise, radiation pressure coefficient. (Decimal point assumed)
63-63 Ephemeris type
65-68 Element number
69-69 Check Sum (Modulo 10)
(Letters, blanks, periods = 0; minus sign = 1; plus sign = 2)
```

```
Line 3
Column Description
01-01 Line Number of Element Data
03-07 Satellite Number
```

09-16 Inclination [Degrees]
18-25 Right Ascension of the Ascending Node [Degrees]
27-33 Eccentricity (decimal point assumed)
35-42 Argument of Perigee [Degrees]
44-51 Mean Anomaly [Degrees]
53-63 Mean Motion [Revs per day]
64-68 Revolution number at epoch [Revs]
69-69 Check Sum (Modulo 10)

All other columns are blank or fixed.

Example:

NOAA 6
1 11416U 86 50.28438588 0.00000140 67960-4 0 5293
2 11416 98.5105 69.3305 0012788 63.2828 296.9658 14.24899292346978

Note that the International Designator fields are usually blank, as issued in
the NASA Prediction Bulletins.

> Only a cynic would envision a scenario where an exchange is made via
> Inmarsat to schedule a CW QSO on 20 Meters. Amazing where technology has taken
> us. I assume all the CW gear was to back up the Inmarsat terminal (-:

Well, 14145 is only a CW freq in the USA (although the 3Y5X operation might have you believe otherwise). No, 14145 from Bouvet and from Norway is that old-fashioned talking-type Shouting, Screaming and Barking mode (it's usually abbreviated "SSB"). No way they could get on and call LA6VM ("others please stand by, this is 3Y5X"). OK, it might not have worked on CW either, but you can't use this incident as an excuse for CW-bashing.

Patty's right, if I were the QSL manager and major organizer of a thing like this, I'd want a QSO for sure. It's actually quite conceivable that LA6VM was on the qui vive hourly, but yes, they probably did use the other link to set up the schedule. I would have done that too.

But regardless of the above, one does have to wonder about the sanity of the whole thing. Of course, it wasn't just a ham radio visit, there were biologists and such (see page 16 picture of two penguins being strangled to keep the population down), but in this case they tagged along with the radio guys, rather than the other way around as often happens with these things. You can't get much for $330,000 these days, and the various postal services did quite well out of the operation.

One disadvantage of the AEA boxes is that they aren't very tolerant
of a bad "fist". If the intracharacter timing is a little long,
all you get is a string of E's and T's. In one of the manuals,
they claim this as a feature, to help with training one's sending.

Also tuning is fairly critical, the input filters are about
100 Hz wide, and at a fixed frequency. (800 Hz on the PK-232, and
1000 Hz (slightly adjustable) on the older MBA units.)

RTTY DX Notes 1of3 9/28/90

RTTY DX Notes for week ending 28th September 1990
BID: $RTDX0928
Part 1 of 3.

From reports received this week, indications are that the bands are
going through a change as shown by the numerous reports of activity on
both 21 and 28 MHz. These conditions should prove exceedingly helpful
with the CQWW RTTY DX Contest this weekend, and final scores should be
very interesting. See you in the mess.

Our thanks this week go to I5FLN (and cluster), JA1BLV, OD5NG TG9VT,
UT5RP, VK2EG, W2JGR, W6/G0AZT and the Tri-State DX Packet Cluster
Network. I see that you have all been busy this past week. Thank you
all for the wealth of information.

UG7GWG 14098 at 0444Z QSL
ZF1RY 14091 at 0501Z
GW4ZAT/5B4 14073 at 0630Z FEC

QSL Information:

Correction to ZF1RY QSL path. Send cards to P.O. Box 5194, Richmond, CA 94805. The Callbook address may give the wrong impression.

7J1AJD/JD1 will QSL via KB1BE.

FW1FM indicates to QSL via Box 15, Futuna Island.

RO4OA will collect his cards from Box 249, Kishinev 277043, USSR.

JH1QDB/JD1 says to QSL to his home address.

BZ4RC is at Box 538, Nanjing, P.R. China.

UG7GWY says to QSL to Box 1, Erevan 375038 Armenia.

V73AT will QSL via K2CL.

UH7E/UZ9CWA cards go via UZ9CWA.

4U1UN requests his cards via NA2K.

UG7GWG collects his cards from Box 54, Erevan 375010 USSR.

Notes of Interest:

7J1AJD/JD1 will operate until October 4th and will include the CQWW RTTY Contest in his effort.

HJ3MCM is a special Colombian call.

OM3BXW is also a special call for OK3BXW.

BV4VB states he will be very active in the CQWW RTTY DX Contest this weekend, as will 7J1AJD/JD1, JH1QDB/JD1, ZF1RY and many other good callsigns.

Saint Pauls Island CY0. FP5DX and VE1KM are scheduled to operate from October 20th with RTTY (and other modes) on 15 and 20 meters. Expected calls are CY9SPI and CY9DX. QSL via FP5DX.

Angola D2 is in the cooking pot as soon as official permission is obtained. It is hoped that RTTY will be included in the operation.

GL DE DX1.

>73, Dube N5PDK

I don't get this message. The FCC law is quite clear that any frequency
may be used under certain conditions. My TR-2600A covers 140-160 Mhz as
a transceiver, and I wouldn't hesitate one moment to use it to contact
a public service agency in the event of a situation in which property or
life was at imminent loss. On the other hand, I'd prefer more conventional
means (such as using the telephone, etc.).

Be sensible. Most public service agencies probably use CTCSS; do you
know the correct frequency to use? They don't tell you this in a scanner
frequency listing. Furthermore, many public service radio systems are
configured with repeaters, etc; the published frequency may be a repeater
output and there is little chance of anyone hearing you on it. Concentrate
on methods which get the best results. Contacting law enforcement agencies
via the telephone will generally work best.

If, for instance, you are in an airplane crash, and there is no nearby
telephone but you have a radio and can contact the US Forest Service, I
sincerely doubt you'd be in trouble.

Hmmmm....I was WN7CSK in 1965, then WA7CSK a year later. I don't think
there were any W calls still being assigned when the Novice was in
effect....or am I wrong? Had some areas not gone to KN and K in the
1950s?

>other ats birds have been launched. Do they still use vhf 136mhz? Any infor-
>mation would be appreciated.

The South Pole has used a satellite called ATS-3 for the past several
years. It has been used to transfer data over a synchronous data link
to a ground station in Florida, as well as for voice comms over a narrow
band FM link to the same ground station.

ATS-1 is part of the same series of satellites launched circa 1967.
The had a life expectancy of 3 years, so it's kind of amazing they're
still running. Both ATS-1 and ATS-3 are active and use the same
frequencies on the transponders as questioned above. The transponders
are different, but both pass FM. ATS-1 is west of ATS-3, and serves
several satellite users throughout the Pacific. ATS-3 has many users in
addition to the Antarctic stations and so time is shared. But you
should still hear South Pole, McMurdo Station, and Palmer Station come
up occasionally.

South Pole however has moved over to another satellite, LES-9, an
Airforce satellite operation on higher frequencies. The other stations
hopefully will soon follow. The data links on ATS-3 were running at
1200 baud (2400 baud possible but not reliable), and the LES-9
operations take place at 2400 baud. LES-9 does not have a transponder,
rather many repeaters on different channels. Voice is possible, however
for the time being, Pole will just be using it for data. ATS-3 will
continue to be used for the voice traffic. You would need a synchronous
modem to decode the data, but even then it's all encryped and so not
much use to anyone.

Voice on ATS-3 is used fairly infrequently except weekends when people
call home. But even then it's only about as interesting as listening in on
20M phone patches.

Technical data on all three satellites is public info, and can be found
in your local library in a good book on communications satellites.
Enjoy!

1555. Yaesu HT470 intermod on ext ant?

Newsgroup: rec.ham-radio
Date: 1990-09-30 01:44:32 UTC
From: rah@public.BTR.COM
Message-ID: <508@public.BTR.COM>
Source record: 8119

Hello fellow netlanders,

As a new ham, I (and my wallet) are looking at HTs to purchase. The decision seems to be coming down to a choice between the Yaesu HT-470 and the ICOM 24AT. I was just about to decide on the Yeasu (lower price, >= features) when this salesman ambles up. His claim was that the Yeasu is a fine ham-bands only machine, but that if I ever wanted it to do anyting else I would be disappointed.. i.e using it with a rooftop antenna for more range or packet would be almost impossible because of intermod - the squelch would never drop so I could never transmit.

Well, I'm not sure I want to DO packet, but I would hate to limit my options.

Any feedback would be appreciated.. Was the salesmans claim valid, or was I being steered to a higher margin device?

Thanks!

-Rick-

1556. Solar Terrestrial Review

Newsgroup: rec.ham-radio
Date: 1990-09-30 04:18:50 UTC
From: std_oler@HG.ULeth.CA
Message-ID: <900929221850.23002d98@HG.ULeth.CA>
Source record: 8108

--- SOLAR TERRESTRIAL REVIEW ---
August and September 1990

Report Issued from Data Released by the
Space Environment Services Center
Boulder Colorado

MONTHLY ACTIVITY SUMMARY AND SOLAR CYCLE OUTLOOK SEPTEMBER 1990 - MARCH 1991

We are now in month 48 of solar cycle 22. Average activity levels and solar indices made a substantial increase in August. Daily values for 10 cm flux, sunspot number and sunspot area reached some of the highest values observed yet this year. In particular, the 10 cm flux value of 315 observed on 26 August was the highest since the 321 observed on 16 June 1989 and the sunspot number of 18 August (394 observed at Boulder) was the highest value since the 395 observed on 10 September 1989. The increases in these indices was sufficient to produce a slight increase in the smoothed values for February 1990. In response to this increase in the smoothed sunspot numbers, the prediction model has risen a little for the next few months, however, not enough to result in a new cycle maximum being predicted. The sharp rise in average smoothed sunspot numbers over the last two months gives a definite impression that the possibility indeed exists for the solar cycle to rise past its July 1989 mark of 158.1. Although to do so it would require several more months of activity equal to that of August's levels.

Flare activity was also up in August. Nearly double the number of energetic events observed in July. Including the largest flare in more than three months, an X3/2B Tenflare with type IV radio sweep from Region 6233 at 21:06 UT on 27 August. This region was by far the most active, producing nearly half of the energetic events observed. Other activity of interest included a satellite level proton event which began at 00:05 UT on 01 August and ended at 11:45 UT on 03 August after reaching a maximum of 230 pfu at 20:15 UT on 01 August. A slight Forbush decrease and a 5 db polar cap absorption accompanied this event. This activity was most likely in response to a long duration M4/2B flare from Region 6180 on 27 July. There were two days of geomagnetic storming at middle latitudes and eight days at high latitudes, including one day of severe storm levels on 23 August. A large filament which disappeared 17-18 August is believed responsible for the 23 August activity.

The increase in activity observed in August may be the beginning of the peak that has been anticipated for several months and is expected to occur in September or October (although very recent analysis indicates that this potential peak may not materialize until October or perhaps November). In any case, this increase in activity lends credence to the belief that solar cycle

22 will have an extended maximum with numerous periods of both high and low activity through 1992.

RECENT SOLAR INDICES (PRELIMINARY) OF THE OBSERVED MONTHLY MEAN VALUES

1557. Need Weather Satellite info

Newsgroup: rec.ham-radio
Date: 1990-09-30 04:22:00 UTC
From: AGENGCC@OSUCC.BITNET
Message-ID: <9009300430.AA29795@ucsd.edu>
Source record: 8109

I need to put together weather satellite receiving station
for GEOS birds. I need the best resolution and and the best
gray scale possible. The output will end up on IBM
compatible computers. I believe I would prefer separate
receiver and WFAX board. I am also interested in the higher
resolution data available from both the GEOS and low orbit
birds.
Any help welcome.

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---
September 29 to October 09, 1990

Report Based In-Part from Data Obtained from the
Space Environment Services Center
Boulder Colorado

--------

GRAPHICAL ANALYSIS OF RECENT GEOMAGNETIC ACTIVITY - BOULDER COLORADO

Cumulative Geomagnetic Activity History
Peak Geomagnetic Activity during the past 87 hours
_____________________________________________________________________
| EXTREMELY SEVERE | | | | VERY HIGH! |
| VERY SEVERE STORM | | | | HIGH |
| SEVERE STORM | | | | MODERATE |
| MAJOR STORM | | | | MODERATE |
| MINOR STORM | | | | LOW |
| VERY ACTIVE | | | | NONE - LOW |
| ACTIVE |* * **|*** *|* | | NONE |

| VERY QUIET |********|********|********|*****| NONE |
|-------------------|--------|--------|--------|-----|------------|
| Geomagnetic Field | Wed. | Thu. | Fri. | Sat.| Anomaly |
| Conditions | Given in 3-hour intervals | Intensity |
|_____________________________________________________________________|

NOTES:
This graph ONLY depicts geomagnetic conditions observed at Boulder,
Colorado for the past 87 hours. Conditions to the north of Boulder will
generally have slightly higher activity than Boulder, while conditions to the
south of Boulder will likely have lower activity than those depicted here.
However, the plots should present a good approximate average of planetary
geomagnetic conditions.
"Anomaly Intensity" is meant to represent nothing more than a very rough
guide to the --potential-- interaction geomagnetic fluctuations --might-- have
on earth-based systems sensitive to magnetic fluctuations (ie. electrical power
distribution networks, telecommunications networks, etc.).
For radio signal propagation purposes, plot lines are approximately
proportional to propagation quality when plot lines are below Minor Storm
conditions. Propagation quality may deteriorate rapidly (ie.
non-proportionally) when plot lines exceed Minor Storm levels. Complete radio
blackout conditions on all short-wave frequencies may occur if plot lines
match or exceed Severe Storm levels.
```

PLANETARY 10-DAY GEOMAGNETIC ACTIVITY OUTLOOK (30 SEPTEMBER - 09 OCTOBER)

```
_____________________________________________________________________

|-------------------|---|---|---|---|---|---|---|---|---|---|------------|
| Geomagnetic Field |Sun|Mon|Tue|Wed|Thu|Fri|Sat|Sun|Mon|Tue| Anomaly |
| Conditions | Given in 8-hour intervals | Intensity |
|_____________________________________________________________________|
```

NOTES:
Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

GRAPHICAL ANALYSIS OF SOLAR ACTIVITY OVER THE PAST 60 DAYS

Cumulative Graphical Analysis of
Solar Activity

```

NOTES:
Latitudinal boundaries are the same as those given above for radio propagation quality. Periods of high auroral activity may be suitable for auroral-propagation. Locally visible moderate auroral activity will almost always cause moderate to strong deterioration in HF signals, while locally visible high auroral activity will render most HF bands useless.

Auroral activity is defined as follows:

NOT VISIBLE: Not visible

LOW: Diffuse, inactive auroral activity visible very near
the northern horizon for mid and low latitudes.

MODERATE: Visibly active, but not exceptionally bright auroral
activity most visible above the northern horizon for
mid to high latitudes. This type of activity usually
encompasses torch-like (or beam-like) aurorae mixed
with low-intensity curtain aurorae.

HIGH: Visibly very active, with periods of bright, pulsating
curtain aurorae possibly mixed with moderate intensity
zenith aurorae. Can occur to the north as well as
stretching up near the zenith, particularly at middle
latitudes. There may be some color fluctuations
discernable.

VERY HIGH: Very active, very bright and very colorful auroral
activity possibly mixed with intense zenith and
curtain aurorae. Visibly strong pulsations with
auroral boundaries to the zenith, stretching even
partway to the southern hemisphere of the sky.

EXTREMELY HIGH: Rare, incredibly bright auroral activity with
rapid color and brightness fluctuations mixed with
very strong rapid auroral pulsations visible
throughout the entire sky.

There are three plotted lines per day in the auroral activity prediction charts. Each of these three plotted lines represent three periods during the evening/morning when auroral activity can be seen. The first line represents the evening twilight period. The middle line represents the --local-- midnight sector, while the last line of each day represents the morning twilight period.

The auroral activity predictions charts are heavily based on recurrent phenomena and may not be accurate in the longer-term due to unforseen and unpredictable transient events (ie. such as solar flares).

The visibility of auroral activity depends on your location and the brightness of the sky (which is dependent upon both city lights and lunar phase). These charts do not account for these variations. The charts are based on dark-sky conditions (lunar phase excluded). Aurorae occur independent of sky brightness, so just because you may not be able to see auroral activity (due to lunar phase, for example) does not mean auroral activity isn't in progress. For best observing conditions, get away from bright city lights.

1559. My Yeasu FT-101E won't transmit on 40 meters...

Newsgroup: rec.ham-radio
Date: 1990-09-30 06:23:00 UTC
From: MULTI@TRIUMFER.BITNET
Message-ID: <90Sep30.022305edt.57497@ugw.utcs.utoronto.ca>
Source record: 8111

I have a problem whereby my FT-101E refuses to load up on 40 meters. ALl other bands work find, but 40 refuses to load up. I haave been operating into a high vswr on 40 meters and wonder if I have blown C26, which is 470 pf rated at 500 wbvdc. Any suggestions would be appreciated, as the rig works fine on all other bands.

Y.N. Miles,
<TRIUMFcl.bitnet>

1560. Being sobered by QCWA eligibility

1561. Proposed 10% federal tax on "electronic equipment"

Newsgroup: rec.ham-radio
Date: 1990-09-30 21:11:23 UTC
From: lauren@vortex.COM
Message-ID: <52.UUL1.3#1@vortex.COM>
Source record: 8122
Cross-posted to: rec.ham-radio,rec.ham-radio.packet,rec.radio.shortwave

Greetings. On Sunday, September 30, agreement was reached by the federal budget negotiators on a proposed new budget, including a variety of program cuts and new/increased taxes. Ignoring the other taxes for the moment (e.g. increases in gasoline tax, energy tax, social security taxes, etc.) there is one brand new tax in the agreement that might be of particular importance to readers of this forum. This is a new "luxury" tax of 10%. Details are sketchy, but it apparently is proposed that this tax will apply on items such as "luxury cars", furs, jewelry, and *electronic equipment*.

As this message is written, it is unclear what that latter category would include. Would it include telecommunications and computer equipment, or "only" televisions, VCR's, stereos, etc. above a certain selling price? Would it apply only to individuals, or to business use of such equipment as well? Would this tax simply be added on to existing state and local taxes at the consumer level?

It might be worthwhile for everyone who is involved in the purchase of "electronic equipment" to carefully track the details of this significant new proposed tax as they come forth, and make their opinions known to their House/Senate members (opinions phoned in *do* get counted by their offices). At this stage, the budget agreement has not yet been approved by Congress, and while the leadership will no doubt wish to have the entire package accepted in one piece, it is not necessarily the case that changes won't be made. It is important that our representatives be informed about the feelings of the technical community concerning these specific proposals.

--Lauren--

1562. Auto Alarm Remotes

Newsgroup: rec.ham-radio
Date: 1990-09-30 22:07:43 UTC
From: schuster@cup.portal.com
Message-ID: <34407@cup.portal.com>
Source record: 8123

What frequencies do the little hand held remotes, used to arm and disarm automobile alarm systems, transmit on? I've disassembled a couple and have never found a crystal, just a single chip and a bank of DIP switches. Are the frequencies varied as part of the encoding process?

You didn't quote the line in the original that prompted the flame which
intimated that the no code issue was a bunch of #$%#. I practiced bloody
fingered guitar for years, but while I could make the notes, I could never
make music. It took a year of struggle at age 14 for me to get an amateur
license solely due to the code requirement. In a related vein, I painfully
used CW for years on the traffic nets (old call WA4VJZ), but never managed
to beat 18 wpm. I believe that CW is like music in that some people find it
easy and others find it nearly impossible. To make it difficult or impossible
for people with no musical talent to become amateurs while letting in those
who naturally find CW easy is blatently unfair. And then to blithely
dismiss the problem as "not a difficult requirement" really sets me off.

Take a look at Part 15 regulations in the FCC rules. Max power 100 milliwatts,
limits on antenna size, and noninterference requirements.

Gary

1565. Re: HT prices & survey

>already done this recently, could you please mail me the results? thanks.
>
>The survey:
>
>1. What is your favorite single-band (2M) HT and why?

Icom IC2. Rugged and reasonably priced.

>2. What features do you think are important in a 2M HT? (e.g., obviously DTMF,
> but what about # channels, sub-audible encode/decode, clock, etc.?)

Thumbwheels to set the frequency (work in the dark, simple, rugged) and a
PL encoder. The rest is fluff. If you must make phone calls, buy a cellular
phone.

>3. What antenna's do you recommend for it and why?

It comes with a duck. If you need more range, buy a mobile rig.

>4. What batteries do you recommend for it and why?

The biggest available. In the case of the IC2 thats a BP8. You need the
extra mass when you use the radio to club a mugger.

>5. Are there any other accessories you recommend?

A rapid charger and spare batteries are musts.

>6. Is there any dealer you would recommend or not recommend?

Go with the one that has it in stock at the lowest price. Dealer service
is mostly a joke anyway. Icom America has good factory service centers.

Naturally my requirements may differ from yours.

>73, Dube N5PDK

Well let me set the record straight. I went from novice to General then took
the Advanced years latter. I copied the letters I recognized and dot dashed
the ones that gave me a mental block. This trick kept me from falling too
far behind and losing the context altogether. By the way, if you mark the
dots and dashes vertically instead of horizontally, it's much faster.

1567. More about 11191 (Interesting UTE)

Newsgroup: rec.ham-radio
Date: 1990-10-01 01:18:43 UTC
From: flash@lopez.UUCP
Message-ID: <1990Oct1.011843.14886@lopez.UUCP>
Source record: 8126
Cross-posted to: rec.radio.shortwave,rec.ham-radio

I want to thank all the folks who wrote me regarding my original posting regarding the navy ASW (Anti Submarine Warfare) activities on 11191 khz. Since my original posting, I have listened a few dozen hours to the utility, and done more research. Here is more info for all who have been tuning in and wondering what all the cryptospeak means:

Most stations have two or three character ID designators.

Station FT (Foxtrot Tango) always has a databurst before he starts talking, and data runs under him.

Stations exchange one another's PAPA UNIFORM, which is either a selcall, or a decryption key, or both.

One of the stations every morning (between 0600 and sunrise) has a tactical ID, such as DRAWKNIFE, During a three day period, each night I heard: Drawknife, Drawknife Alpha and Drawknife Bravo. Other similar tactical callsigns have been heard.

NUKE-O does indeed refer to encrypted traffic. It is not "new code" as one poster thought, but: NUCO

for:

NATO
UNIFORM
CODE of
OPERATIONS

When a station says NUCO, all information following is encoded, and when they say UN-NUCO, then the encryption is over.

So when someone NUCO's information, it is encoded.

ALIGATOR is apparently an Air Force AWACS plane, and it is possible that this station is the TACTICAL one.

The secure channels are on UHF (I confirmed this two nights ago).

The operations every morning are most likely an excercise practice.

During the day, activity on 11191 are quite different. It sounds more like a SAC channel. The daytime alternate frequency given is 6712khz.

Hope the above is helpful.

More than one person who wrote experessed an interest in more UTE postings, and even a UTE group, or UTE mailing list. I don't believe

there are enough folks out there to support such a group, but I think postings to rec.radio.shortwave would be appropriate.

I am also crossposting this to rec.ham-radio, with replies to rec.radio.shortwave.

KEEP MONITORING!

The ARRL Letter - Volume 9 - Number 19 - September 21, 1990 - Part 1 of 4

DEFENSE PULLS OUT OF DRILL

U.S. involvement in the Middle East has forced a major Amateur Radio-government emergency exercise to be scaled back. The National Disaster Medical System (NDMS) steering committee, acting on a notice from the Department of Defense, has cancelled a full scale drill scheduled for Oct. 10-13, but local drills still may be carried out as planned.

In a letter from Peter B. Collis, M.D., Deputy Assistant Secretary of Defense, the department advised that "Because of their respective commitments to Operation DESERT SHIELD, DoD...found it increasingly difficult to provide the level of activity this exercise [the NDMS drill] deserves and is necessary to support its successful conclusion." The letter in particular noted that Defense already has "cancelled or delayed a number of annual war games, open houses, and community relations programs, in order to meet mission requirements in the Middle East."

One role of DoD was to support communications via Military Affiliate Radio System (MARS) stations; this work now will be carried out on normal Amateur Radio frequencies.

The drill is based on an "earthquake" along the New Madrid Faultline in the Central Mississippi Valley. ARRL section managers will receive more information in the next Section Manager's Letter from Headquarters.

FCC ADOPTS WARC NOTICE

The Federal Communications Commisssion on Sept. 19 adopted its second Notice of Inquiry in preparation for the 1992 World Administrative Radio Conference. The text of the 150-page NOI (in General Docket 80-554) has not yet been released, but it is said to contain specific recommended U.S. proposals for WARC-92. Responding to the Second NOI will be the best opportunity for the general public to express its views on WARC-92 matters, but the time for comments will be very short.

ARRL continues to participate in the development of the U.S. WARC-92 position through the FCC Industry Advisory Committee and CCIR. The Industry Advisory Committee met Sept. 14 in Washington to hear status reports from its five Working Groups. Key WARC-92 issues include expansion of high-frequency broadcasting, low-earth-orbit mobile satellites, satellite and

terrestrial digital sound broadcasting, future land mobile systems, and high-definition television by satellite.

The ARRL Letter - Volume 9 - Number 19 - September 21, 1990 - Part 2 of 4

ANNOUNCING THE WORLD RADIOSPORT FEDERATION
Group's Goal is Amateur Radio at the Olympics

Amateur Radio will be an Olympic Games event if an ambitious proposal by a small group of hams becomes reality. Spurred on by the success of the World RadioSport Team Championship (October QST, page 43), a plan to form a World RadioSport Federation has been announced by an international group of amateurs.

The WRSF is targetting the 1996 Summer Olympics, which will be held in Atlanta, GA.

The International Olympic Committee has four main ground rules which a sport must meet to be considered for the Games:

* The sport must be actively practiced in 50 countries by men and by women in 35 countries;

* There must be a sanctioning organization acceptable to the IOC;

* Periodic regional events must take place between Olympic Games;

* There should be a mechanism to establish a world championship.

The WRSF would meet these criteria by establishing an international consortium of radio societies, local radio clubs, individuals, and corporate supporters. But beyond the immediate goal of the Olympics, the Federation would seek the general betterment of Amateur Radio around the world.

In their Proposal for Discussion, the organizers note Amateur Radio's recognized value as a pool of trained operators able to provide a variety of communications services. They cite a perceived "public image crisis" for Amateur Radio, "resulting from ineffective, inadequate, or nonexistent efforts devoted to self promotion."

The WRSF believes that radiosport events (such as the team championship in Seattle) and associated educational efforts can be used as a vehicle both for promoting Amateur Radio and for recruiting new hams.

Radiosport events can demonstrate to government officials and the general public the purpose and value of Amateur Radio, the proposal says. The argument is bolstered by noting that recent international operating events (DX contests) attract upwards of 40,000 amateurs worldwide--a pool of potential WRSF members and ambassadors.

The not-for-profit WRSF would support the activities of the International Amateur Radio Union; "activities and initiatives undertaken by the WRSF are intended to enhance accomplishment of IARU goals and objectives," the proposal says. The purposes and objectives of the WRSF are to:

* Encourage the growth of Amateur Radio by promoting and supporting operating activities which enable successful recruitment of new participants, especially young people;

* Enhance individual operator knowledge and skill in emergency communications techniques and procedures;

* Provide an international sanctioning organization for on- site and other radiosport events;

* Promote increased awareness and understanding of the Amateur Radio service among government officials and members of the general public.

The ARRL Letter - Volume 9 - Number 19 - September 21, 1990 - Part 3 of 4

ANNOUNCING THE WORLD RADIOSPORT FEDERATION
(Continued from Preceding Part)

WRSF membership would fall under four categories, and the planners have estimated the following makeup: Voting members (total of 15); Associate (50); Sustaining (1,500); and Corporate Sponsors (10). A geographically diverse board of trustees would be elected by and from the voting membership, while a slate of corporate officers would be elected annually by the board. Six working committees would handle specific activities.

The promoters acknowledge that initially members would come from the ranks of contest operators and DXers around the world. They anticipate support from "more traditional" hams over the long term.

The WRSF would be financially independent of all other Amateur Radio organizations. Funding would come from initiation fees and membership dues, as well as from corporate sponsors. The promoters see an eventual annual budget in the range $175,000 to $250,000.

The federation would assist local groups in conducting competitive activities--with the inherent spin-offs of public relations and education--by promoting the following kinds of events:

* Mini HF Field Days. Two-person teams would construct and operate stations under simulated emergency conditions. Local winners would qualify for national, regional or international on-site competitions that would be staged during international contests such as ARRL Field Day and the IARU HF World Championship. International on-site events would be held at least every four years, concurrent with the Olympic Games.

* Amateur Radio Direction Finding. Long popular in Eastern Europe, the USSR, and Asia, these events would pit contestants in various age groups in a test of both physical stamina and radio technique. ARDF would permit amateurs not proficient in Morse code to be competitive.

* Communications Accuracy Contest. These traditional CW and voice pile-up copying contests would be sanctioned for holding at hamfests and radio club meetings.

WRSF would establish rules and guidelines for all the events mentioned above, and would help finance regional and international events.

The federation would maintain an international speakers bureau, to speak and to conduct workshops and seminars explaining and promoting Amateur Radio. In time, it would seek to establish a scholarship program, and to maintain a fund to aid developing countries in conducting Amateur Radio events and demonstrations. Young people would especially be targetted, through such international groups as the Scouts and the YWCA and YMCA.

The WRSF promoters believe it likely that neither national radio societies nor the IARU have the resources necessary to address, on a worldwide scale, the issues of recruitment of new amateurs and of communications training. The WRSF will seek "appropriate recognition and endorsement by the IARU," believing that "successful achievement of WRSF goals and objectives is closely tied to receipt of official recognition and moral support from the IARU and its member societies."

In the next few months, the organizers will tend to such matters as legal incorporation, election of an initial slate of trustees and officers, the establishment of committee chairmen, and obtaining essential business equipment. Then planning of a detailed agenda will begin.

The founders and supporters of the idea hope to hold a worldwide teleconference within the next 30 days, according to John Crovelli, W2GD. Among the founders are Martti Laine, OH2BH, ARRL New England Division director Tom Frenaye, K1KI, Northern California DX Foundation President Rusty Epps, W6OAT, and Boris Stepanov, UW3AX, deputy editor of *Radio* magazine.

Persons interested in this ambitious endeavor may contact John Crovelli, W2GD, 200 Woolf Road, Milford NJ 08848, for a copy of the 21-page Proposal for Discussion. A large SASE with four units of first class postage would be appreciated.

The ARRL Letter - Volume 9 - Number 19 - September 21, 1990 - Part 4 of 4

BRIEFS

Space Shuttle STS-35 bearing the SAREX experimental Amateur Radio package was postponed again Sept. 18 and it now appears the flight will not be rescheduled earlier than November, as other waiting Shuttle flights have priority over the scientific mission of STS-35.

* Postal rates probably will rise around February, 1991, sources say. While first class letter rates would rise from 25 to 30 cents/oz., the impact on second class mail publications such as QST would be much greater--31 percent. At current membership levels mailing costs for *QST* could increase some $88,000 per year. By using the "printer's newsstand/postal pool" and mailing from several points around the country the League could save about one-quarter of this amount (QST is printed in Glasgow, KY). International rates also probably will rise (QST has some 10,000 non-U.S. subscribers/members, including Canada). International rates can be--and often are--changed with as little as one month's notice.

* FCC has issued a public notice regarding unlicensed devices transmitting in the 900 MHz range, particularly video transmission systems. These systems ordinarily use a wireless receiver and transmitter for remoting video devices such as VCRs, video cameras, and games, as well as television pictures and audio. Such devices fall under "additional unlicensed use" of frequencies and as such have no protection from interference from Amateurs or any other licensed service.

Companies which have received FCC grants of equipment authorization for their video transmission systems include: Gemini Industries, Recoton Corp., Star Tech Company, Video Technology Engineering, and Wiso Electronics. Grants of equipment authorization issued by the FCC appear monthly in a public notice entitled Certification/Notification Actions. Customers experiencing RFI to such devices should contact the manufacturer.

* The ARRL Volunteer Examiner Coordinator staff is processing about one Morse code waiver upgrade package per day for disabled applicants.

VE statistics for June and July (the most recent months available) include 8435 exam elements administered in June (4075 by ARRL VEC), and 7617 in July (3098 ARRL). 2640 applicants were served by ARRL VEC in June, 1853 in July.

* ARRL's East Coast Educational Workshop hosted 55 people in Gaithersburg, MD on Sept. 8, many of them newly licensed or unlicensed teachers interested in introducing Amateur Radio to their classes. The League was represented by Educational Activities Coordinator Rosalie White, WA1STO.

* Between now and Oct. 1 ballots for division director and vice director elections will be mailed to ARRL full members in the Central, Hudson, Northwestern, Rocky Mountain, and West Gulf Divisions. In each of those divisions, there is more than one candidate for one of the two offices. The ARRL Election Committee has declared the following, as the only eligible candidate, elected for the 1991-92 term:

Director, Central Division: Edmond A. Metzger, W9PRN;
Vice Director, Hudson Division: Paul Vydareny, WB2VUK;
Director, New England Division: Tom Frenaye, K1KI;
Vice Director, New England Division: William Burden, WB1BRE;
Vice Director, Northwestern Division: Mary Lou Brown, NM7N;
Director, Roanoke Division: John C. Kanode, N4MM;
Vice Director, Roanoke Division: James G. Walker, WD4HLZ;
Director, Rocky Mountain Division: Marshall Quiat, AG0X;
Director, Southwestern Division: Fried Heyn, WA6WZO;
Vice Director, Southwestern Division: Wayne Overbeck, N6NB;
Vice Director, West Gulf Division: Sam Sitton, KV5X

* The ARRL Letter often relies on readers for news tips. When you see or hear something of interest please send it to ARRL HQ, or give us a call.

* CORRECTION: The last issue of *The ARRL Letter* was Volume 9, Number 18.

> via the telephone will generally work best.

I know the repeater input frequency and the CTCSS tone frequency for each of the frequencies in use in my area. This can be a problem with travelling.

How did I find out what the CTCSS tone was? Well once I figured out what the input frequency was, I found I really could hear many transmission on there (so in turn they could have heard mine if I transmitted on the output frequency) and I was able to figure out their CTCSS using my tone squelch feature I added to the radio.

By the way, for low-UHF repeater pairs, the standard 5 MHz offset applies.

I have programmed a few of the frequencies in memories. I set the transmit offset to the correct amount but in the WRONG direction. This will reduce the chances of causing accidental interference, but still be a means to get to the correct frequency should an applicable emergency come up.

Is there any known way to get the IC24 to accept a repeater offset in other than 25khz steps? There are a number of repeaters with oddball offsets and as it stands there doesn't seem to be a way to deal with them (using only one radio, anyway...) Thanks much.

--Lauren--

> Gary, I'm very disturbed by your lack of thought concerning my posting.
> In the beginning of my posting, I prefaced it with *I* ... These were *my*
> feelings; I was not attempting to say that 'this is the way it is'.

The fact that you did not do so on the sentence regarding how easy the
5 WPM code test is, others, such as maybe Gary, might have taken it as
a statement of generality.

> You, on the other hand, displayed a true lack of 'brotherhood' in the
> advancement of ham radio. Yes, I agree that certain people have trouble
> learning the code. I maintain that in most of these cases, it is because
> 1) they choose to have a hard time at it by a lack of HONEST effort over
> a period of time and 2) because people like you promote the attitude that
> its silly and you don't need to learn it. "You can cheat your way through
> this way: let me show you. "

There are people who have trouble learning code or many other things due
to not putting the proper work into it. But that does not account for all
the people who have trouble learning. There are legitimate reasons. One
of them is people who are profoundly deaf, and the current FCC changes do
NOT account for that, because the waiver does not apply to the 5 WPM test,
which they cannot pass "by ear". Next there really are people who just
cannot learn code at all.

Like you, I found that Morse Code was easy to learn. I spent about 6 hours
of study on it outside of the 5 class sessions, and that was enough (just
barely enough) to pass the test. I have since forgotten it.

Is the Morse Code requirement silly? Longtime readers of this newsgroup
already know how *I* feel about it. But I suggest that the position is
a personal one for each individual.

> I'm sorry you have had such a bad experience with CW. I tend to think

> learning the code for the ham radio tests.

There are many successful musicians who cannot play the guitar. Can you
play the piano. Would you require passing a guitar test in order to allow
someone the privilege to sing?

The things you mention, "time, desire, ambition, patience, diligence and practice" are definitely needed ... if Morse Code is the mode you want to operate. And you have already mentioned that you like it.

But like the guitar test would have no purpose for someone who is not going to play a guitar, the Morse Code test has no purpose for someone who is not going to use Morse Code. There are certainly many people who do use Morse Code in ham radio just as there are many musicians who play guitar (I even know some who do both).

> Gary, I do hope that you can learn to further the efforts of ham radio
> operators in a more respected manner than what you are displaying. It is

> detriment to the radio community as a whole. (I bring to mind the recent
> 20 meter wars, and also leave you to think of the deplorable condition of
> 11 meters.)

The participants of the 20 meters mess either passed the code test, or else cheated somewhere along the line. In either case, the existance of the code test did not keep them out.

> I, personally, will continue with my enjoyment of CW and will more than

> CW is necessary. And, I hope that my mentor (I fear to call him an Elmer,
> his hair isn't grey enough! :-)) doesn't have such discouraging words
> as you do. Otherwise, I would probably abandon ham radio completely.

I don't think Gary would have been that way with someone he was helping to get into the hobby. Like myself, Gary would be happy to encourage someone to learn code and get into the hobby, even if he knew (and probably even more so because of it) that person was primarily interested in just CW. There are people like that still coming into the hobby.

Let me ask you if you would have been so diligent at learning the guitar if all you were really interested in doing in music was to sing, but to get a "permit" to sing, you had to first learn how to play the guitar?

Or let's reverse this a little. Suppose in order to get to play the guitar in public, you had to learn to play the oboe and pass a test on the oboe? Would you be so diligent at playing the oboe?

As much as I admire Icom equipment, you were being had! My FT470 suffers from some intermod in downtown Atlanta, but so does my Icom and in the same places and in about the same amount. ALL of the wide receive coverage HTs suffer from out of band intermod to some extent. The FT470 got a bad rep because it's first IF falls in such a way that the National Weather Service frequency image falls on a popular 146 Mhz repeater frequency. Yaesu will shift the IF for you at no charge if this is a problem in your area. Because HTs normally work with such a poor antenna (ducky), they are made to be very sensitive. So wide receive coverage and high sensitivity add up to intermod problems when you hook any of the newer HTs to a good antenna.

You can avoid overloading your HT with out of band signals by putting a cavity in the line to your outside antenna (highly recomended), or you can buy an HT that doesn't have wide receive coverage such as the IC2 from Icom, or you can buy a base rig for use with outside antennas.

HTs are nice, but like multimode packet/rtty/amtor/fax boxes, they are a compromise. A dedicated radio for a dedicated purpose will be superior to a radio that you attempt to force to be everything to everybody.

The salesman may have fallen prey to the rumour mill and may honestly have thought he was giving you good advice. The margins are slim on Icom as well as Yaesu. If, on the other hand, he had tried to steer you toward a Kenwood, well then he was trying to get his hand in your pocket.

>learning the code for the ham radio tests.

I knew it. I have contended for a long time that musical talent and CW
skill go hand in hand. Every high speed CW op that I have discussed this
with has admitted to being musical. Most of the folks who have trouble
with CW admit they can't carry a tune in a bucket. Personally, I wasted
several years of bloody fingered practice trying to master the guitar.
I could technically sound the notes perfectly, but I could never make
music. Similarly, I spent a year of very hard work building enough code
speed to pass the exam, but I still get a mental block at times even on
the simplest letters, even E. I found that writing the dots and dashes
down at such times allowed me to continue copying without getting hopelessly
behind. You don't seem able to understand this. Because it's "easy" for
you, I must not be "HONESTLY" trying hard enough. Please also consider
that Samuel Morse's original telegraph made marks on a strip of paper that
were later deciphered by the operator. This is the way old Sam intended
the Morse Code to be used. I don't consider it cheating to use his methods.

Copying the message correctly is what it's all about after all, not showing off a musical talent.

> Gary, I do hope that you can learn to further the efforts of ham radio
>operators in a more respected manner than what you are displaying. It is
>a worthy hobby of talented and willing individuals. Perhaps one of the

>20 meter wars, and also leave you to think of the deplorable condition of
>11 meters.)

I hope you will learn that your view of the world is not the only view.
I hope you will learn that there are other people in the world who don't have your musical gift, but have other fine talents that can contribute to the betterment of Amateur radio if the artificial barrier of the CW exam is removed. And I can't resist pointing out that the 20 meter warriors all passed a CW exam.

I admire people who can make beautiful music, on a guitar or on CW, but it takes more than effort to make music, it also takes talent. That's something a person is born with and, like the color of his skin, something he can't change no matter how hard he tries.

Just laid in a Kenwood TH-75A 144/440 MHz handy-talky, and I have a couple of questions for the net types.

1) Is there any way to clear a memory location (i.e. restore it to "unset" status) short of re-initializing the microprocessor and dumping all the memories at once? It matters when there is something loaded into memories 8 and 9 since they control the "programmable" band scan. You can't do a full scan unless they're empty. How do you empty them out?

2) Anybody got any nice handy undocumented power-up sequences or internal mods?

REVIEW:

The Kenwood TH-75A is a nice hefty piece of equipment that will run 2 watts on the supplied battery (7.2 volts) or 5 watts if you shove in a huge battery or run it off your car. As usual there are five or six different kinds of batteries you can shove onto the thing.

ADVANTAGES: The display is easy to read. Some displays have severe shadow effects if illuminated from the side - not this one. The buttons are widely spaced and easy to use for the fat-fingered. Some units have larger buttons, much more closely spaced. It's difficult to avoid pressing two buttons at once on those. The built-in audio is of excellent quality, as the speaker is larger than most on the market. The unit supports scanning both bands at once, and can work fully cross-band, listening on one while transmitting on the other. The manual has been written by a native English speaker; no "Japenglish" to be decyphered. The rubber duck antenna is a thin-whip type giving excellent coverage. "At 2.2 liters it's good only for hand-to-hand combat..." Well, not exactly, but you can sure club a mugger with this baby. It looks like it would be none the worse for wear, either. It's built like a tank.

DISADVANTAGES: There are almost too many features. This radio takes about three hours to learn how to drive, and there are some features which aren't explained in the manual...you just have to crash around, causing interference etc., until you figure out just what the heck is going on in there. There seems to be no way to clear a memory location to "unset" status, which is actually a desirable thing to want to do - see question (1) above. There is no memory for autopatch phone numbers, a feature some other units have - very handy while driving not to have to punch in a whole phone number. While the manual is clear, some things in it are not. (Example: turning on CTCSS for receive also turns it on for transmit, though there is a

separate button for doing this. This isn't documented - nor does the tone-encoded transmit indicator come on in the display. It makes sense in retrospect but it's puzzling as hell when you're trying to figure out why a given repeater sometimes hears you and sometimes doesn't.) The actual effect of the "battery save" function isn't explained, either. It doesn't turn off the display - that's "Auto Power Off." There are more things like this.

WEIRDNESS: At the touch of a button the whole thing turns into a pager, and turns off almost all its other functions in so doing.

UPSHOT: Seems like a good unit, at the bottom of the price range for dual-banders. Mine cost $440 at Ham Radio Outlet.

I just saw one of those TV comercials for a device that "old folks" can
carry with them that has a panic button on it.

When the button is pressed, it somehow gets a message to the local ambulance.

How do these things work?

My guess would be that the device is a low power 300Mhz transmitter
(like wireless burgular alarms or newer car alarm control boxes).
A receiver would then be connected to a telephone auto-calling device
which phones the ambulance and plays a pre-recorded message asking for
help.

1588. FOR SALE: Grove "Power Ant III" Preamp

Newsgroup: rec.ham-radio
Date: 1990-10-01 18:38:46 UTC
From: stoppani@rust.zso.dec.com
Message-ID: <1337@rust.zso.dec.com>
Source record: 8149
Cross-posted to: rec.radio.shortwave,rec.ham-radio,rec.ham-radio.swap

I have a Grove "Power Ant III" antenna pre-amp that I'd like to sell.
It has a max gain of 30dB and the gain is continuous (as appossed to
a switch where you select a specific gain like 5dB, 10dB,...). It
uses type F connectors (one for antenna input and two receiver outputs)
and it comes with an AC wall adaptor. Dimensions are: 4"Wx2"Hx3"D.
The preamp also comes with two coax leads to the receiver(s) with the
following connectors: PL-259, 1/8" mini-jack (for portables), and a
BNC connector (for scanners).

To summarize, here is what's included:

Grove Preamp
AC wall adapter
Two coax leads (about 2 feet in length, F connectors at both ends)
One F to PL-259 connector
One F to 1/8" mini-jack connector
One F to BNC connector

List price is $79.95 (for the preamp) plus 12.95 (for the cables and
connectors). I'll sell it to the best offer. Oh, I'm selling the preamp
because my newest radio (an ICOM R70) has a built-in preamp which works
quite well so I no longer need the Grove preamp.

Agreed, but....

> >2. What features do you think are important in a 2M HT? (e.g., obviously DTMF,
> > but what about # channels, sub-audible encode/decode, clock, etc.?)
>
> Thumbwheels to set the frequency (work in the dark, simple, rugged) and a
> PL encoder. The rest is fluff. If you must make phone calls, buy a cellular
> phone.

They may WORK in the dark, but so do LCD's. You just can't see either one.
Fortunately the LCD rigs usually come with a builtin light. With the IC-2,
you have to fumble for a light if you don't know what the current setting is.
I have IC-3AT, IC-4AT, IC-2GAT, and IC-32AT so I know how they work.

> >3. What antenna's do you recommend for it and why?
>
> It comes with a duck. If you need more range, buy a mobile rig.

The AEA 1/2 wave (not a 5/8 wave) give very good extended range.
The improvement over a duck is more than going from low to high power.
Couple that with high power and you can approach what a mobile can do
in those circumstances where a mobile rig isn't practical (such as
pedestrian mobile). The mobile rig with a properly installed antenna
certainly will do much better, but the half wave whip is a good idea.
Larsen also makes them.

> >4. What batteries do you recommend for it and why?
>
> The biggest available. In the case of the IC2 thats a BP8. You need the
> extra mass when you use the radio to club a mugger.

There are bigger available. They last longer (1200mah), are an inch
longer, and have more mass. I have 4 of them. I've never tried them
on muggers yet. The 1200mah gives me 2 days of continous receive-only
operation WITHOUT the power saver. If you have the power saver ON, and
turn the radio off when you know you are not listening, they could last
a week or more for no transmit activity. The 800mah BP-8's, however,
might well give you all the capacity you need. If I was going to do it
all over again, I might well go with the BP-8's instead. I cycle each
pack through one day of service, one day of full slow discharge, and
two days of slow charging.

> >5. Are there any other accessories you recommend?
>
> A rapid charger and spare batteries are musts.

If you have enough spare batteries, you won't need a rapid charger.
I don't even own one.

The alkaline packs are really a good idea since you can plop in some
alkalines bought just about anywhere. I'd recommend the 8 cell variety
if you get the newer radios that can handle 12 volts. Icom makes 6 and
10 cell versions. Most alkaline cells are sold in packs of 2, 4, and 8.
Never mix alkalines of difference level of usage.

> >6. Is there any dealer you would recommend or not recommend?
>
> Go with the one that has it in stock at the lowest price. Dealer service
> is mostly a joke anyway. Icom America has good factory service centers.

Also consider a more local dealer if they meet your needs. You can get
faster shipment at cheaper rates that way, as well as it being pratical
to go "drop in" on them in person if you need to. I live in Urbana IL
and usually buy from AES in Milwaukee, Ham Station in Evansville IN,
Universal in Columbus OH, or R&L in HAMilton OH (R&L's emphasis).
I usually see second day delivery from regular UPS shipments, except
from AES I typically get next day from regular UPS shipments.

> Naturally my requirements may differ from yours.

Of course, everyone's requirements and needs are all different. The best
thing to do is think carefully about what yours are. If you still don't
figure out what is the best to buy or do, posting the specific needs might
get some better suggestions.

I don't normally read rec.ham-radio, just rec.ham-radio.packet... but a friend pointed me here since my name was mentioned...

>> He said the most popular license in Japan is what he called
>> "Novice Radiotelephone", which has no code requirement, but a significant
>> theory exam
>
> He was right. I have mentioned this before on this forum. The
>Japanese have a no-code HF licence. The power is limited and this is
>the key.

Yup. It's interesting to note that the Japanese attitude seems to be "see how we can do something good without completely breaking the rules", instead of "oh, but someone might construe that as wrong so we better not do it"... not a bad comment on the two cultures, in general... ?

> Bdale who I am told speaks Japanese and has visited those Islands
>could possibly enlighten us further.

Actually, I don't speak very much Japanese... just enough to get in deep trouble trying to order dinner! But, I've been to Japan twice, both very pleasant and informative trips, and I continue to talk to my Japanese friends via email quite regularly... it was fascinating on my last trip to see how many young (college age or so) people were *active* in ham radio, and to see how many unexplored corners of packet were being investigated...

Wish we had that level of interest and enthusiasm in this country... [sigh].

I've been using some orange ethernet wire (Mowhawk 5713) and it appears
to be better built than any RG/8 that I've seen. It's double braid
shielded with two layers of foil and some type of foam dielectric
(teflon?) with a solid #12 center conductor. I've been getting great
results on HF but have not yet tried it with VHF or higher. I've
run about 70 feet of it outside, sheathed in an old garden hose and
buried in the gravel out to a Butternut vertical. I'm still looking
for a Mowhawk catalog for the specs to be sure.

>in return but trouble.

If someone (whether volunteer or not) decides that they will arrogate to
themselves the authority to determine which code-copying techniques are
"acceptable" and which are not, a judgement which is completely outside
the authority given to him by the FCC, and for that reason decides to
disqualify a given applicant - that's called "abuse of authority".

If you don't follow the rules you're given, and damage someone else as a
result, you're likely to be sued. I wouldn't have it any other way.

>with me and it can communicate with the authorities, then IS is THE
>fastest means possible.

Yes - but make sure that it's an emergency as defined in FCC rules. If
the "injury" is a simple broken arm (i.e., non-life-threatening), the
use.

Having asked folks in the State of California about it (and getting
incredulous responses like "you can really do that?", here's what they
suggested:

First, DO NOT try to use the normal procedure of the agency you're trying
to talk to. You want your transmission to be absolutely distinguishable
from normal traffic. For example, the CHP dispatch center in this area
has the tac call sign of "Santa Ana" - to get their attention and report
an emergency under this method, I would probably say "Highway Patrol
dispatch, this is amateur radio station N6BMO with emergency traffic."

That's the second one - make sure the words "emergency traffic" are in
there somewhere. After that, just talk to them.

>I would followup any such use of the radio with a written report to the
>appropriate authorities so they would know exactly "what, when, and why"
>of the incident. Only after that will I be able to REALLY find out how
>they react to such use of their radio frequency.

Make sure that one of these "appropriate authorities" is the FCC Engineer-
in-charge of your area - this falls under his purview, and the person who
gets the story in first generally has the best chance of keeping his
license :-).

This way they never had to worry about the BARF net moving on frequency,
telling them that they were in violation of regulations for handling
communications that by their signifigance, are only legal on public
networks for hire!

Satcoms allowed them to keep the ham bands for approved hammy type
pursuits, while the nuts and bolts type comms were via Telex.

Oh, I'm getting so tired of hearing people tell me why I shouldn't use my radio to call the police.

I care more about saving a life, any life, than this whole hobby! Yes, that's right. Lives mean more to me than HF, OSCAR, and RTTY DX combined. Those of you who can't understand that need read no more.

Now, if Bob's Quick Mart is across the street, I'll go there. But if noones around, I'm calling. I'll bet it's illegal to cross the interstate. Is that going to stop you from helping someone? It's probably illegal to flag down a car with a cell phone. Is that going to stop you? I guess all you people really concerned about this will just drive on past, maybe even stop if you can find a legal parking spot, or go home and call 911 from there. Thanks. In the meantime, I will have stopped and if noones on 2m or around me, I'll already have contacted the police my own way. 'Nuff said.

|>--

I used to install these things for a local hospital. You're correct on
the transmitter.
I don't have any idea what freqency range they use, but they are keyed
either by freq.
or by some code to a particular receiver. There were several different
ones, and if
you had two subscribers next door to each other, you would put in two
different codes.

The boxes automatically call the monitoring service, either local or a
national one in
a different state. There is a data transmission which identifies the
box to the service.
They have a file, made out on subscription, on each box which identifies
the person,
medical conditions, responding agencies, etc. The service always calls
the house first
to check for false alarms. If no answer, they call a predesignated call
list starting
with a neighbor, etc. on down to the police or ambulance. The boxes
also have a timer,
which can be disabled. If the timer is not reset every 12/24 hours, the
box calls the
service and informs them of that, in case the person could not signal
himself. It also
automatically calls on low battery condition of the large battery

backup. Pretty good
little system, actually, but not cheap. The ones I put in were
subsidized by the hospital
and cost the subscribers $20/mo.

Help! Ive fallen and I can't get up.....

Immmm, Immmmmm having chest pains......

My guess is that the transmitter carried by the person only has to reach
a local transcever (in their home) that is tied into the phone line. This
in turn dials a local alarm company that then calls the family and proper
emergency people. Of course ive never seen one and this only my guess so
the ususal money back offer is invalid :-)

Generally, the little remote controls (and the big ones for garage doors also) are around 318 MHz with a VERY weak digital "bleep" or "buzz". The one I had was on 318 (rather wide signals) and could be heard on an appropriate scanner RIGHT BY the unit when activated.

I don't know if there is a pre-recorded message or not. There would have
to be if there is not easy way to identify the phone number. It does open
a room speaker to the phone line.

The remote control I saw uses and audio tone pair to activate the system.
It looked quite cheap to me.

The increase was announced well in advance. If you didn't know about it before your renewal came up and you don't know how the money is used, then you probably *are* wasting your money sending in a renewal, since all you did was pay dues -- you never allowed yourself to be a member. The "L" stands for "league -- an association or alliance of persons for common action.", The dues is not some award you are granting to the league -- it's a payment partly to pay your cost to the organization (QST) and partly to help advance its goals. The League needs the money, but you're not really a member unless you're involved. The very least involvement is reading the magazine, and that was where the increase was announced.

If you really want to know what's being done with it, the audited financial statements of ARRL for 1989 start on page 56 of the May, 1990 issue of QST. I also suggest reading the article on page 18 of March, 1990 QST.

Considering that the last dues increase was in 1981, I think we've done a pretty good job of holding the line on expenses. But you'll have to decide for yourself whether the services available from ARRL, plus the contents of QST, plus the opportunity to help protect and defend the Amateur Service are worth $30/year to you.

**** UoSAT-OSCAR-11 BULLETIN 30 September 1990 ****

UoSAT MISSION CONTROL CENTRE
University of Surrey, Guildford, Surrey, GU2 5XH, England

** UO-11

Suggestions on the most useful operating schedule for UoSAT-2 should be sent
to UoSAT as soon as possible so that they can be taken into account during an
operations review due to take place later this month.

** FO-20

FO-20 is continuing to experience high temperature problems (due to the
spacecraft experiencing no eclipse periods during which it can cool down)
which is forcing a drastic reduction of operations. As of the weekend of 29
Sept 90, the battery temperature had risen to near 45 degrees C. Extended
exposure to high battery temperature will decrease the useful life of the
battery.

From To Mode
011090 0900 021090 0910 PSK Telemetry acquisition
041090 0955 041090 2330 JA
081090 0920 081090 1110 JA and JD
111090 0825 121090 0850 JD
```

The above dates and time are in UTC and the schedule may change without notice. The FO-20 Command Team will be monitoring satellite performance and operations during these times and may turn off the transponder if they determine that the satellite is in danger.

** MIR

A new and exciting amateur radio project is being planned for the Mir space station known as the "Amateur Radio Experiment on Mir" or AREM. This project is the result of a collaboration between the Soviet Union and the Austrian Amateur Radio Society (OeVSV). It is designed to provide equipment for both 2M packet data and voice transmissions from Mir. The voice messages will be spoken in German, Russian, and English and will alternate with packet transmissions. The first AREM operations are expected to begin around January 1991 when an Austrian cosmonaut will install the station after he joins the crew of the Mir. To obtain further information about AREM, please write to:

Wolf Hoeller (OE7FTJ)
Amraserstrasse 19
A-6020 Innsbruck
Austria

** AO-13

The present transponder schedule for AO-13 is as follows:

Mode-B : MA 003 to MA 165
Mode-JL : MA 165 to MA 195
Mode-B : MA 195 to MA 240
Off : MA 240 to MA 003 (Mode B Beacon On)
Omni Antennas : MA 240 to MA 060

The September 10 attitude estimate is:

BLON = 205 and BLAT = -7

** AO-10

Until further notice please DO NOT use AO-10's transponder.

** BADR-1

Would any stations receiving signals from the BADR-1 spacecraft on 145.825 MHz and 144.010 MHz please send brief details to UoSAT - thank you.

Thanks to AMSAT-NA ANS and its contributors for much of the above information, there is generally insufficient 'room' in the UO-11 Bulletin to give regular acknowledgements.

** $BID **

Please use BID $UOSAT.930 for PR BBS use.

1609. Info on Preamps for OSCAR-13 wanted

Newsgroup: rec.ham-radio
Date: 1990-10-02 15:49:40 UTC
From: phil@hansen.Berkeley.EDU
Message-ID: <1838@lupine.NCD.COM>
Source record: 8161

I just got my OSCAR-13 satellite system all up and running and wow is it a blast! My first contact was with a FINLAND station (OH5LK) and I made 6 more with various US stations.

Although I could copy most of the stations it was not easy (I do not have a preamp for either 70cm or 2M). So I would like to get information about preamps that are available and the only one that I know about is the Landwehr preamps that Henry radio sells. I am looking for a preamp that has RF switching in it and can handle greater than 100 watts (currently run 30 watts but I don't want to fry a expensive PREAMP)..

So If you know of a good vendor please send to me their name, FAX number, phone number, or address so that I can get the info!

Thanks in advance!

Phil

>Better or worse (or the same?) as CATV hardline??
>
> Pete Lucas G6WBJX@GB7SDN.GBR.EU PJML@UK.AC.NWL.IA 0793-411613

I use it. I can't really say I see any difference between it and RG-213.
Figures I have extrapolated from the Belden book indicate its about 1/2 db
better than RG-8. It certainly has better shielding but have fun putting
on connectors. I use a razor blade to get the inner foil off the Teflon.
No, its not near as good as CATV hardline, but have lots of fun putting
connectors on that, too. I have an article at home about building 1/4 wave
matching sections from copper tubing to convert 75 ohm CATV stuff to 50 ohms.
Its probably not worth it considering the 1.5/1 SWR match anyway. Ham Radio
magazine? I'll look it up for the interested. A concern about electrolysis
between the copper and aluminum kinda bothers me.
Of course the line loss is only worth considering at VHF freq. and above
for practical purposes.
Oh yes, Ethernet double shielded coax is 50 ohms (and stiff).

1611. Gear for Sale/Swap

Newsgroup: rec.ham-radio
Date: 1990-10-02 17:53:37 UTC
From: GRAY_S@DICKINSN.BITNET
Message-ID: <9010021755.AA09292@ucsd.edu>
Source record: 8165

Greetings to everyone on the net. I have the following gear for sale (or swap)...please drop me E-Mail at GRAY_S@DICKINSN.BITNET or call me at (717) 258-5477 if you have any questions/comments/wanna deal.

Drake T-4XC (sn 27721), R-4C (sn 25595), AC4 (32792). They are in perfect condition, recently back from a complete factory overhaul. I have put them on the air only long enough to ensure that they are in 100% top notch condition; everything works great and the TX4C puts out 150 watts without effort. The only options that I have for the Drakes are extra 10 meter crystals, but the price includes Drake boxes, manuals, *and* Drake invoices from the work done this summer. The price on the Drake C-Line is $450, -or- I am interested in making a swap for an HF transceiver in equally excellent condition.

MFJ-949D Versa Tuner II (with PEP metering). Mint condition - price: $115

MFJ-931 RF Ground. In mint condition as well - price: $45

Cushcraft AR-2 FM Ringo. Never outside - price $20.

Cushcraft ARX-2B Ringo Ranger II. Excellent condition - price $30.

73,
Steve Gray

I use my Yaesu FT-470 connected to a Ringo Ranger II through an amp/preamp
and have no problems using it on packet. I think the salesman wanted to
sell you something else (personal favorite, larger markup?). I do get
some intermod once in a while, but no more than I did with the ICOM IC-32AT
I had before. The 470 is a good little radio for the money IMHO.

1613. Cushcraft R5 Vertical

Newsgroup: rec.ham-radio
Date: 1990-10-02 19:28:23 UTC
From: jmseb@cbnewsd.att.com
Message-ID: <1990Oct2.192823.19132@cbnewsd.att.com>
Source record: 8168

I recently purchased a Cushcraft R5 vertical. Since there has
been interest from time to time about limited space antennas and
the R5 in particular, I thought I would share my experience with
the R5 so far.

Why did I buy the R5? I live in your typical suburban subdivision
where the houses are relatively close together and the lots are small.
While towers and beams are not expressly forbidden, I have never seriously
considered putting up much steel and aluminum. My operating is casual
and my favorite activity is DX chasing. I can almost hear the peals of
laughter throughout the net: "that poor fool, ya just *can't* work
DX with a vertical!!" Well, read on.

First, I have been chasing DX for several years and I have *always*
used a vertical. My DXCC total (worked) stands at 210. I know it would
be considerably higher if I spent more time on the air and I followed
the DX bulletins religiously. But I am not a fanatic about it. The
point is, my station can do the job.

My previous antennas were a Hustler 4BTV (40/20/15/10 quarter wave
vertical) at my previous QTH, and a Cushcraft R3 (20/15/10 m half wave)
at my present QTH. The 4BTV was mounted on the chimney of my two
story house and had resonant radials arrayed around the roof. It worked
fine. At my new QTH the roof geometry did not allow the radials, so
I went with the R3 (this was 1985) which does not require radials (nor
does the R5).

The R3 was also mounted on the chimney and was about 30 feet above the
ground. I had several problems with the R3, however. The R3 had a base
mounted motor driven tuning capacitor which was controlled from the shack.
Once in the middle of winter the control cable opened up. So much for
operating (except on one frequency) 'til spring. Then recently, some
sort of intermittent problem occured. I suspected the coax and connectors
but replacing them did not fix it. I suspect now it is a flaky trap.
When it worked, however, the R3 did a good job. I could generally work
anything I could hear. A pile-up sometimes needed the KW afterburner,
but usually I stuck with 100w out.

So...needing a relacement for the R3 and being generally satisfied with
its performance, I popped for a new R5 (about $270).

The R5 is a 20/17/15/12/10 meter half-wave vertical, adding two more bands
over the older R3. It uses factory tuned trap sections to resonant the
antenna on the different bands. Because of the inductance of the traps
the overall length (height) of the R5 is somewhat less than the R3.
The most significant difference, however, is that the R5 uses a broadband

passive impedance matching system which eliminates the motor driven tuning capacitor. No more worries about control cables. To make this work, however, the R5 needs four 48 inch stainless steel radials at the base and a capacitance "hat" just below the first trap. So instead of a staight "stick," the R5 has these things sticking out, which can complicate getting it to its final mounting place (the chimney on the roof in my case). More on this below.

The assembly is easy and quick, aided by an excellent set of instructions. I first put it together on my deck and propped it up for tests. Surrounded by trees and 12 feet from the aluminum siding of the house, the SWR on the various bands did not look like the curves given in the instructions. But I didn't expect it to be so. High and clear is the rule for this type of vertical. Even from the deck, several 20m European and USSR contacts were easy with 100 watts (my QTH is near Chicago).

The next day was time to put it "high and clear" on the roof. To do this I took off the base radials and the capacitance hat and broke the antenna into two sections. The antenna is very light (8 lbs), but it is too easy to damage the radials and hat in the process of carrying it up to the roof. I reassembled everything up there and clamped it to the chimney mount. The coax connection was thoroughly sealed with "Coax Seal." I did not use and do not recommend the connector boot and silicone grease supplied with the antenna.

Back in the shack the SWR looked very similar, though not identical, to the "typical" curves in the instructions. But even so, the R5 appears to live up to its advertising as being less than 2:1 over most of its five band range. Excellent! In my favorite sections of the bands, it is 1.5:1 or less.

So, does it work DX? You bet. With only 100 watts, I was again able to work anything I could hear, and I could tell the others on the bands were not hearing anything I couldn't! Over two evenings I worked 20m Europe, USSR, and Middle East stations. One nice surprise was having a 4S7 come back to my first call one morning via long path while other North American stations called in vain (had their beams pointed the wrong way I suspect). No KW needed so far.

Overall, the R5 seems to be an excellent antenna and well-engineered. It fits my needs, operating style, and environment very well. It is not cheap, but for me the value is there.

Needless to say (I hope), I am not connected in any way with Cushcraft. These opinions are mine alone.

P.S. If anyone is interested in a five year old R3 with a possible flaky trap, its yours cheap (shipping charges only). Send me email.

1614. 10% Electronics Tax apparently "cancelled" -- for now

Newsgroup: rec.ham-radio
Date: 1990-10-02 19:39:07 UTC
From: lauren@vortex.COM
Message-ID: <54.UUL1.3#1@vortex.COM>
Source record: 8027
Cross-posted to: rec.ham-radio,rec.ham-radio.packet,rec.radio.shortwave

Greetings. Good news. It took a bunch of phone calls to pin this down, but it *appears* (for the moment) that the proposed 10% electronics tax did not make it into the final draft of the budget agreement that is currently under consideration. As late as Monday afternoon, personnel at our U.S. Senator's office believed the tax *was* in there, and that it *would* affect computer and telecommunications equipment, as well as consumer electronics. Other sources gave the price level at which the electronics tax would kick in as either $100 or $1000, depending on who you talked to. Meanwhile, on Monday morning, the Wall Street Journal published an article saying the electronics component of the tax was *not* in the final agreement. So there was considerable conflicting information.

Much of the confusion apparently revolves around the many drafts of the agreement and the incredible flurry of activity involving consideration of the budget.

In any case, according to a phone conversation I just had (Tuesday, around noon, PDT) with a Wall Street Journal writer who was by far the best versed on this topic of anyone I had reached anywhere, the 10% tax on electronics equipment is indeed *not* in the present agreement. According to current info, the 10% tax *would* apply to:

Furs over $5K (except leather and artificial fur)
Jewelry (including watches) over $5K
Private boats and yachts over $100K
Autos over $30K

This is all to take effect this coming Jan 1 if the budget agreement passes.

The electronics tax was indeed in the agreement originally, but was dropped from the final draft, apparently.

It is important to note, however, that this is all subject to sudden change. The electronic equipment tax could reappear at any time in the negotiations, either now or later. So it would be a very good idea to keep as close a track of the developments as possible, because if changes occur we probably will have VERY little time to react and let our opinions be known. And of course, there are many other aspects of the budget agreement, in terms of other taxes, fees, program cutbacks, etc., that are also very important, and about which our representatives would appreciate our input, I'm sure. Apparently they haven't been getting very many calls about the budget, and they really are interested in hearing voters' opinions when you call.

Given how difficult it is to obtain basic information about something
as important as the budget, the more people in the technical community
keeping abreast of what's going on, from different angles, the better!

--Lauren--

>Icom, or you can buy a base rig for use with outside antennas.

Gary

I am having this problem with an FT207 and am wondering what a cavity is, where to get one, and how much they cost. Since I only paid $115 for the ht, I hope it won't be much.

You were right on about NOAA, I wasn't hearing it at all, with my rubbery ducky or even with my broadband radial at 7 feet, but when I put it up 24 ft, it came in loud and clear.

Thanks

I have a few questions. Any answers?

1) Does anyone know what the deal is with the STS-35 shuttle mission?
I'd like to get involved with the SAREX mission from the Amateur Radio
Club at my school (Northeastern University, Boston, Mass.)

2) I finally passed my Novice and Technician exams! (Four days apart from
each other). Does anyone know what the call signs being given in ITU
region 1 are at the Extra level? If I am able to go for my Extra by the
end of this year, or early next year, will I receive a 2x1/1x2 or 2x2 call?

3) Does anyone know HOW radio amateurs became known as 'Hams'? Is there
a rational reason for the term?

Thank you very much in advance for any answers you can supply.

If you reply privately, please send e-mail to: Sehrlich@lynx.northeastern.edu

Maybe if they were AFSK on FM or true FSK played back through an SSB
transmitter, sure it could be done easily. But my guess is that
it's neither. Any definate answers on the format/modulation and/or
frequency? Is it digital or analog? Is there any sort of a standard?

BTW, what's stopping car thiefs who are aware of Lo-Jack from buying
a $200 frequency counter from checking for 900 MHz signals? Seems
simple enough to me.

The slots for two-way contacts with Ron Parise were filled long ago,
but anyone who likes can listen to his transmissions on 2 meters.
Since you're 'way far north, that might be a problem, as the inclination
of this mission's orbit will put it out of range for much of the U.S.
You might be able to get in on the listen-only patches from the
southern hemisphere stations to the Telebridge system. I don't know
whether the ARRL is accepting more applications for this, but you
could call them and ask.

>3) Does anyone know HOW radio amateurs became known as 'Hams'? Is there
>a rational reason for the term?

The ARRL researched all the theories (acronym for four hams' last
names, etc.) years ago and determined that the most likely explanation
was that the term derived from "ham-fisted", which was applied to
poor operators in the old days of telegraphy. I think the word has become
less pejorative since. Maybe. :-)

1621. Help - Routing Problem

Newsgroup: rec.ham-radio
Date: 1990-10-03 10:42:42 UTC
From: ZZATSJH@cms.manchester-computing-centre.ac.uk
Message-ID: <9010031132.AA09562@ucsd.edu>
Source record: 8031

Greetings,

Last night I went to a committee meeting of the North-West Packet User Group (NWPUG) and it came apparent that we are having routing problems in the UK in that Packet mail is not always reaching its destination outside the UK.

We are trying to track down the problem, and were wondering if all the people on these two lists were to send one short message to me on packet plus a copy to me here at work (so that we know how many messages to expect), it would help us to plan the forwarding a bit better.

I'm fairly new to this newsgroup and to its contents. However, I'm not exactly new to amatuer radio. My father has been acitive on 2 meters for as long as I can remember and the bug is catching. Bascially, I'm looking for personel insight on getting started, such as learning code, basic technical knowledge that is good to know and so forth. Hopefully I can pick up lots of general knowledge along the way as well as get some feedback. All responses are welcome.

Source record: 8032

Some of the close range stuff like the remote "find your car" stuff I've
been told operates in selected channels in the 30-50 MHz abnd, or so I've
been told.

The 'pager' type systems usually operate in CB band, on the class D
channels, where there is NOT supposed to be any traffic like voice.
These are the channels between 3-4, 7-8, 11-12, 15-16, and 19-20.
There used to be 2 more between 22 and 23, but these are now CB channels
24 and 25. The D channel between 15-16 is usually bootlegs by SSB
operators, and the channel 19-20 is usually torn up by trash and splatter
from 19. The channel from 7-8 is also usually torn up by *$$h@L&s trying
to run skip. For some reasing there is a whole class of idiots, beyond
your worst CB nightmare, that hang there and on CB channels 6-8. The
other class D channels are relatively clean, but relative is a touchy
term.

I think class D used to be restricted to 100mw, but now has a 1W limit.
Be careful with these setups, as they use the regular car antenna. They
usually work well, but if you have a retractable......

The other danger is a lot of cars have CB/AM/FM antennas. These devices
are designed to plug into the AM/FM antenna, and pass AM/FM through to
your radio, with circuts to block and protect the radio from the 27-50MHz
signal. With multi-band car antennas there are filters and/or splitters
at the base of the antenna also designed to do the same thing. If these
devices are hooked up to the AM/FM cable, and there is a blocking device
at the antenna, then the pager sees a high impedance load it can't handle.
Besides being bad for the pager, sometimes the circuits designed into the
pager to 'protect' the AM/FM feed from the signal can't handle the voltages
now present, and the 1W transmitted siganl now gets into the AM/FM radio
at levels high enough to burn out the first stage. CHECK YOUR SETUP!!

In my case, I had an AM/FM/CB antenna on my one car, and I took the AM/FM
feed to the radio, and the CB feed to the pager, then tuned the pager for
maximum output into a field strength meter.

I got a big laugh from Phil's note about the aircraft with ZANTOP on it- particularly his friend's recognition of it as a Russian craft.

Many years ago I worked at Detroit Wayne County Metropolitan Airport, DTW to all you air travellers. Next to my building was, you guessed it, the home of Zantop Airways. They're a small airline that at the time ran a few cargo DC-3s and a few Lear Jets. They were notable then for having crashed *2* Lears into gas tanks near the airport, and for the fact that the owner's sone was the youngest licensed jet pilot in the country.

ZANTOP used to have a hangar at Indianapolis Int'l Airport. A guy who
worked elsewhere at the airport told me they hauled freight,
especially automobile parts for car assembly plants. He was rather
uncomplimentary, saying that their planes were ancient and in poor
mechanical condition. I later heard that they got in trouble with FAA
for maintenance violations.

Indianapolis Air Route Traffic Control Center, also located at the
airport, has an _enormous_ HF log-periodic beam on an extensible
tower. Wonder what it's for? I know that overseas ATC uses HF SSB,
but I think Indianapolis Center handles handles only domestic traffic.

For those interested in a plausible conjecture, take a look at page 47
of the October, 1990 issue of Worldradio magazine. If they are right,
it is the congress-critters who first started to use this term to
address radio amateurs back in 1911.

>Sometime in the near future,
>I want to "upgrade" ;-> to a Collins S-line station.
>Does anybody know which models are the most desirable,
>and which ones to stay away from?
>73 N6MZ

I recently "upgraded" to an S-line station as well and did quite a bit of investigation in the process.

I ended up getting the 75S-3 receiver. It covers 3.4-30 MHz in 200 KHz segments. It came from the factory with crystals covering all of 80, 40, 20, and 15 meters; 28.5-28.7 MHz; and 14.8-15.0 MHz (WWV). The 75S-3B is identical except it has a second crystal board built-in that is switchable from the front panel. This allows you to add crystals for more frequencies. All models let you increase coverage on 10 meters and add coverage of the WARC bands.

The 75S-3C is almost twice the price of the -3, but probably isn't worth it.

There are three transmitters in the line: the 32S-1, the 32S-3, and the 32S-3A. The 32S-3 has all of the features of the 32S-1 and a spotting control. Likewise, the 32S-3A has all of the features of the 32S-3 with the addition of a second switchable crystal board.

All of the transmitters run 175 watts PEP input SSB and 160 watts input CW.

The S-line does have a few quirks common with older equipment. For example, the antenna connections on both the receivers and transmitters are RCA phone jacks.

I'd recommend getting the 32S-1/75S-3 combination. The newer models have a few additional features, but they're not worth the almost double price. (I've been told the S-line is very popular in Japan and the Japanese hams have driven the prices way up).

I got my S-line from Associated Radio in Kansas. They specialize in reconditioning Collins equipment and generally offer top-of-the-line product.

1631. ethernet coax

Newsgroup: rec.ham-radio
Date: 1990-10-03 19:35:21 UTC
From: rfc@briar.Philips.Com
Message-ID: <109446@philabs.Philips.Com>
Source record: 8035
Cross-posted to: rec.ham-radio,rec.radio.shortwave

Someone asked about Ethernet coax, so, from my files:
(from 1 1/2 yrs ago:)

I found out from an engineer at Belden some attenuation values:

Ethernet (#9880) Freq(mhz) attenuation(dB) per 100 feet
1 0.19
5 0.37
10 0.52
50 1.2
100 1.7
200 2.5
400 5.0

RG8U (#9914) 50 1.2
100 1.6
200 2.4
400 3.5

As you can see from the above table, Ethernet coax is similar to RG8U coax to 200 Mhz. It's a little worse than RG8U for 400 Mhz. But it should be just fine for 2M and 220 bands. They test up to about 10000 Mhz and there's no sudden deviations from a smooth frequency vs attenuation curve. And they say that Ethernet coax should be able to handle about as much power as RG8U. The foam stuff, mind you.

When you acquire used coax (not surplus brand new coax), you have to be aware that it could have something bad about it. Look for holes in the braid (where taps may have been), water damage, and anything else that could make any coax bad. Of course, the best coax to get is coax that is new and never used, and never exposed to water or weather.

Ethernet coax should work fine for most amateur applications up to 220, assuming that it is in good condition. Don't know how well it stands up to being outside, as compared to RG8U, but the teflon coated stuff should be fine. In all likelihood, the yellow pvc stuff is just like the black pvc insulated (coated) stuff. I saw one person post that he used the yellow stuff outside for 5 years with no noticeable degradation. I used Ethernet to drive my 2 meter antenna dedicated to packet (so, it still is in a digital mode! :-)). One last thing, the shield is excellent.

I suppose you could use regular RG8U in computer installations, except that the center conductor of RG8U is stranded, not solid like Ethernet. Vampire taps might not bite into it so well. Also, building inspectors will complain

that RG8U could burn.

This is very true. However, it is possible to calibrate the s-meter so
that its reading accurately reflects the signal strength at the antenna
terminal of the receiver. As with any other measuring instrument, you
must maintain its calibration or it becomes just a relative device again.
Most of us don't have the means to do the calibration, and most of really
don't care. Signal reports are, for the most part, subjective anyway and
sometimes vary depending on whether you give yours first, or the other
station does.

>In the meantime, I will have stopped and if noones on 2m or around me, I'll
>already have contacted the police my own way. 'Nuff said.

Not quite. You can just call your nearest repeater (isn't that why you have
your rig?) and either dil 911 directly or have someone do it. That way, you
won't have to explain your call. If you make an unauthorized call, you will
spend a lot of time explaining to the dispatcher, or whomever, who you are,
and why you're calling them directly. If it's precious seconds you're try-
ing to save, you surely won't do it this way. And if it's *my* life you're
trying to save please don't use this means. By the time you get through the
hassle I'll probably have been carried to the hospital by a real Ham.

>
>I'm not entirely certain what you mean by this, but if you mean that there's
>been some arrangement allocating all of his downlink time to certain stations,
>that's not my understanding.

In return, Paul, I'm not sure what you mean by "allocating all of his downlink time." :-)

Ron has scheduled a number of voice QSOs with schools (about 30 in all). The times of these runs were posted here before the last launch attempt and probably will be again later.

Anyone who is in range of the shuttle at the time is welcome to listen to his side of the QSO on 2 meters. If you want to hear both sides, you can listen to WA3NAN or one of the other NASA ham stations that will be broadcasting on HF.

Because the shuttle will be mostly outside the range of U.S. hams, some mechanism was needed to relay between the U.S. schools and the shuttle. AMSAT is setting up a link wherein the schools' transmissions will be relayed via telephone lines to ground stations (hams) in other countries who can contact the shuttle. And of course, Ron's transmissions will come back the reverse route.

The company providing the phone link is the same one that helps with the Teleconference Radio Nets. They are kindly also providing a number of listen-only slots for each bunch of QSOs (usually about 20 minutes worth).

About 800 schools applied to participate in the STS-35 mission. As I said, about 30 or so were selected for two-ways; the others were invited to take a listening slot. I don't know whether all of them were given slots; it depends on how many ports the Telebridge folks are donating. (They normally make their living from providing this service for real money, so it's really nice of them to donate all this time for SAREX.)

All this, of course, has nothing to do with the packet robot, which hams will be able to access only with direct contacts. It also doesn't rule out the possibility that Ron will take the mike for unplanned voice QSOs. But the scheduled voice Qs are all with schools.

Bottom line: I don't know whether any listen-only dial-in ports
are still available. The League would know. Other than that, hams
can listen on 2m (if in range of the shuttle) or to the HF rebroadcasts.

Patty

>You're joking, right? Slots for two-way contacts? What is this, a
>sked-only operation? Who came up with this brain-dead idea?

1. No.

2. Yes.

3. For voice QSOs, yes, mostly. As I mentioned in my other posting,
Ron is free to make unscheduled voice Qs if he has the time and the
inclination. He's a big boy now and can make his own decisions.

4. The ham astronauts. Take it up with them. (Perhaps they felt that
conveying the excitement of amateur radio directly to schoolchildren
was a little more valuable than trying to work hordes of hams calling
each other names on the receive frequency. But that's just my guess. :-))

DAK MR101 RECEIVER

I just received my new MR101 receiver from DAK and am very disappointed with its performance. I intend to return it but don't know if I should have them send a replacement or

faintly hearable on the built in antenna.

The performance on SW2 (9.5 - 21 MHZ) is excellent as is FM and MW reception.

This radio is packed with slick digital glitz but really sucks as a receiver. However, at $49 it is probably too much to ask for.

I took a walk over to Radio Schack today and found that they have the same radio with some minor v

1641. icom fast charger (BC-72A)

Newsgroup: rec.ham-radio
Date: 1990-10-04 07:18:36 UTC
From: lauren@vortex.COM
Message-ID: <55.UUL1.3#1@vortex.COM>
Source record: 8045

Greetings. Has anyone done some measuring of the charge currents for the BC-72A to determine how well the charger handles different situations? Some primary concerns are:

1) Charging of partially charged batteries. The sparse instructions say the unit will detect a full charge, but then goes on to say you shouldn't charge a full battery and that the unit will stop fast charging of a full battery after 5 minutes. In the general case, will the unit properly handle the fast charging of a partially charged battery without overcharging? Let's ignore "memory effects" for now...

2) After the unit stops fast charging, it goes to trickle charge. What is the current rate for trickle charge? Is it the same as for the "slow" chargers that come with the various radios, or slower still? The main issue is how long can you leave the battery on the charger in trickle mode after fast charging has ended without damaging the batteries? Overnight? All day and night?

3) Is it correct to assume that with all these Icom SAT, etc. radios, the radios' internal nicad batteries (when present) are never charged if you charge with the fast charger when an external battery pack is in place? I assume that this is the purpose of the BA-12 adapter--to provide a way to charge the internal batteries with the fast charger?

And finally:

4) Does the internal lithium rechargeable battery, used for memory backup, etc., stay charged from the external/internal nicads? That is, if you always charge the external batteries separate from the radio, and never plug the radio itself into the wall chargers, will the lithium battery stay at full charge (presumably deriving charge from whichever external nicad is attached to the unit)? Or is occasional "wall charging" through the radio jack itself required to keep the lithium rechargeable up to snuff?

Rechargeable batteries have to represent one of the most misunderstood aspects of modern equipment. Thanks much.

I used to have a very high opinion of Canada, and the Canadian people, when I lived in Windsor, Ontario, for 4 years. I thought that their government, although different from the government of the United States, was pretty reasonable (being fairly representative of the will of the people). I didn't like how socialistic Canada was, but at least they didn't have a Draconian government like some of the former governments of the Eastern Block countries.

The latest report from VE6BBM makes me think that perhaps Canadians are loosing rights faster than we are in the states. Seriously, prohibitions against owning certain equipment, because you aren't licensed to connect it up to an antenna and radiate? Requirements to notify both the local and the federal gov't each time an antenna installation is modified? No more reciprocal operating agreement with the United States?

While Europe is busy unifying, and preparing to become the largest economic power in the world, and getting rid of the old regimes (in Eastern Europe), both Canada and the United States are busy taking rights away from their citizens. (Some examples from the states include gun control/restrictions, defacto suspension of the first ammendment both for free speech and free practice of religion, defacto suspension of the right against unreasonable searches and seizures, and taxation without representation. I'll be happy to cite examples of all of these if challenged.)

Has this not been true already? I have noticed phone operation in the lower part of 40 meters. I thought I even remembered a VE operator (in this newsgroup) who said he stayed there to avoid talking to US operators. What did the subbands used to be?

>4) ***** US amateurs will now require an operating permit from the DOC
> ***** before they can operate in Canada!

I am very disappointed in this one. It was a real thrill to bring my 2 meter rig at the last moment on a trip across Ontario (from Niagra Falls to Windsor). It allowed me to really get a taste of the local flavor and left me with a very positive impression of the local ham community there.

I assume that the US, in its typical wisdom, will stick to the present scheme and not reciprocate. [Is it still true the US citizens cannot buy property in Canada, while the US gets sold off to Canadians, et. al.?]

>7) I'm not 100% certain about this one, but I believe there is also

Another message mentioned that because of the fact that the shuttle is not
going to be flying over the US anyway, the contact is going to be via
phone to ham stations in other countries and then via radio to the shuttle.

Correct me if I'm wrong, but if the schools are going to be talking on the
phone, what is going to make them think this has anything at all to do
with Amateur Radio??

It looks to me like an advertising for MA Bell. "Gee mom, we had fun in
school today. We called the space shuttle on the telephone."

The only ones who will know that this had anything at all to do with ham
radio are the hams. I believe they call this preaching to the choir.

Just sign me disappointed. :-(:-(

>hassle I'll probably have been carried to the hospital by a real Ham.
>

First I would like to state that I don't modify my rigs for out of band
transmit and have no intention of starting now.
But this statement is ridiculous too.
Example: I used to work in Rockville MD and live in Gettysburg, PA. As
you might imagine, it's a memorable commute, especially at rush hour.
Well, one evening right around dusk, I got rear-ended at the part of
270 where the road narrows down to 2 lanes from 3 lanes (up by Germantown.)
I could hear probably 2 dozen repeaters and bring up 12-14 of them.
I could NOT get anyone to talk to me. I could not use the auto-patch on
any of them cause I didn't know the access codes. After sitting on the
inside shoulder of the road and continuously jumping from repeater to
repeater trying to find some one to call the police (a necessity as
the other car was damaged to badly to drive) finally a traffic reporter
for a Fredrick, MD radio station came by and called the police on his
cellular phone. It was almost 3 hours and pitch black before the
police got there. If I had relied strictly on ham radio, I would probably
still be sitting there today.

I don't necesarily condone jumping on the police frequencies when ever there
is a problem but to anyone who has driven 270 at rush hour, the potential for
a serious accident should be obvious, cars traveling at 60-70 mph disabled
vehicles off on the INSIDE of the highway, there is no shoulder, just a thin
strip and then a concrete barrier. Luckily nothing else happened but I have
learned my lesson. I no longer rely on ham radio as a practical means of
communications in an emergency. If it happens again, I won;t even try the
radio. I will just flag down some guy with a cellular phone.

|>

Yup, sked-only. Nope, not brain-dead. It has always been up to any given ham who they want to talk to and how they want to do it. In this case, Parise wants to talk to school kids and scheduled particular slots of time to do it in so they can know when they'll be able to talk. That's his right. Of course hams who don't like it can always QRM the transmissions to show kids what ham radio is all about...

On the other hand, there's always the packet robot for those of us without a sked.

|>is perfectly legal to copy the code as described. In other words, the
|>volunteer examiner made a mistake.
|>
|>So you're going to SUE him? [...]

The guy's a volunteer. OK, they get one "attaboy" for that. The guy decides the job he volunteered for is one he doesn't like, so he changes the job. There goes the attaboy. The guy prevents a person from obtaining a legally-deserved license on the basis of personal whim. Yes, he can be sued. Also if the nice guy who volunteers to be a school crossing gaurd decides to frisk you, he can be sued. If the hospital volunteer decides to throw the medication in the trash rather then walk it down to the patients room, they can be sued. It's not only legal, it's proper.

We want volunteers, not vigilantes. If you volunteer to do a job and do it, you are deserving of the highest possible praise. If you volunteer to do a job and then betray those who trusted you by forcing your personal adgenda on the public, you deserve to be sued, flogged, dipped in hog vomit, fried to a crispy crunch and hung up as a warning to others who would subvert the volunteer's good work.

Source record: 8059

With all the bad hype going around on this newsgroup and the S/N plummetting every day, I thought I'd mention this - I know it made me feel good about amateur radio...

About three weeks ago, we had a member join one of the repeaters that our club co-sponsors. Only a week after receiving his membership package, which included the autopatch codes, he was driving up the Northeast extension of the Pennsylvania turnpike in a 2m-equipped tractor trailer. About 30 miles from the repeater, he witnessed a rather wicked accident which resulted in one of the cars involved flipping over numerous times. He stopped, and was able to pull one of the victims out of the car, but the other was still pinned inside, unconscious. He called the PA state police via the repeater's autopatch, and they responded within minutes, along with the paramedic units and fire department. They were able to get the second victim from the car; shortly afterwards, the car caught fire.

The next day, the ham who had called in the accident contacted the state police. They told him that the victim that he had first pulled from the car was recovering and doing well, but would have been in much worse shape if the paramedics hadn't come so soon. The second (trapped) victim was also recovering and the outlook was good, though she was still in the intensive care unit.

IMHO, this is what amateur radio is all about. It's not supposed to be a competitive sport to see who can work the most countries, get their Extra the quickest, or send CW the fastest. Public service, technical advancement, and international good will are what this hobby was founded on. Let's keep it that way. Now if we can just get that #$(%*@ from calling his friends on the autopatch from inside his own house, we'll be in good shape...

If you listen to the CW subbands much, you can readily tell who has
the rythm and who doesn't. Some hams flail along at varying speeds,
and with varying spacings between characters and words; while others
rock along in a lilting cadence that is a joy to copy. There's a lot
of 'in-betweens'. Some people are just getting used to their keyers,
so must leave them out until they get the hang of it; and some 1x3 calls
are just trying to unlimber their rusty keys. But I do believe that
at least the rhythm aptitude helps both sending and receiving. One Ham
I knew years ago mentioned that when he listened to music he sort of
imagined dits and dahs and tried to derive characters and words from lthe
music. It is, after all, about cadence and spacing.

Let me guess. It has an ARRL diamond enclosed in a circle with
a slash bar across the middle. ;-)

FWIW, I have been an ARRL member since 1981 (my first year
licensed) and have just renewed my own membership. I am annoyed at
the Board minutes in last month's issue detailing the creation of
several new paid staff positions at HQ. I don't recall being asked if
I wanted to hire anybody else.
If somebody can point out a reference in QST where members were
asked in advance about adding more salaries to the ARRL budget,
please do so. I will then take a hunk of humble pie into my library
to read it.

Several years ago I heard someone on a local police channel who obviously wasn't comfortable with HT operation or police procedures. The dispatcher talked with him. It turned out that one of the cops that had responded to a residence had left his HT behind. The dispatcher asked, on the air, if any of the cops knew who might have left an HT behind. He was still on duty, it turned out, and got to go retrieve his radio. I wonder who got debriefed in this case ....

> mission?

Postponed until at least November due to unresolved Hydrogen
leaks in the orbiter aft compartment. Discovery now has launch
priority and at this writing is in the countdown process on Pad 39B.

> 2) I finally passed my Novice and Technician exams! (Four days apart from

> or 2x2 call?

Congratulations. I don't believe the USA is in ITU Region 1.
I'm pretty sure we are in Region 2. In any case, it's not the ITU
that issues amateur callsigns to individual stations. The FCC still
has plenty of callsigns left in the 1st Call District, which is what I
presume you really meant. Better study the regulatory structure just
a little harder. This is not a flame or put-down. One of the major
arguments against entry-level licenses is that people can get on the
air without knowing some of the basics.

> 3) Does anyone know HOW radio amateurs became known as 'Hams'?
> Is there a rational reason for the term?

Hey, that's two questions! ;-)
Lots of people claim to "know" the origin of the term "ham" but
they all have different stories. Rational? Dunno...

It may be for the FAA's domestic HF backup network.

In article <26fc6203-69arec.ham-radio@vpnet.chi.il.us>, akcs.dunnbri@vpnet.chi.il.us (Brian Dunn) writes:
> Is it legal for a packet radio station to run 'online games'? If so, has
> anyone prepared any games for use with packet radio?

Yes (it is legal) ... games can and are played all the time on the air.... from Chess, to Adventure and ZORK... to traditional Amateur Radio games of 'chasing DX' (trying to talk to distant stations) and on the air 'contests' (trying to talk to more stations than your fellow hams).

> The ability to have up to 16 connections to the same machine at one time
> makes for some interesting possibilities...

Actually, some TNC's support up to 26 users (times two for dual port) (Kantronix). Of course, these TNC's can be 'networked' together to gain 'almost' an unlimited number of users spread over a wide area (i.e.: PacketCluster).

> I'm reasonably close to finally getting a ham license, and the answer to
> these questions will partly determine whether I start off with HF or VHF.
>
> Does anyone get a little nervous at the thought of packet games filling the
> frequencies???

No (no nervousness), this sounds just as useful to me as a 'contest' or other 'non-public-service' use of Amateur radio frequencies.

Brian (and the net), several of us a few years ago were bashing about this idea and thought that it would be GREAT fun.... There is no legal problem with it... the only reason that it has not been done yet is that none of us are 'game implementers'... If you are PLEASE develop a game and make it available... Of course, you don't need a Amateur license to develop software (even software for Amateur Radio :-)), but it is more fun to be able to join in on the fun with your license....

By the way... there are systems that already connect a multitude of users (many times over 100) to a common 'database'... the PacketCluster software does this. It is 'sort' of a game, if you think about it... One user 'alerts' the others of a rare station that is on the air on a certain frequency... then sits back and gets to see who works the rare station first. It is kind of comical to watch a pile-up develop from these packet spottings. A person can even detect them on the air, it is obvious when all of a sudden a whole group of stations from the same geographical region start calling almost at the same time (within seconds to minutes of one another).

Don't worry about 'filling the frequencies'... we would rather 'use-them' than 'lose-them'....

By the way, my DOSGATE system has several 'text based' games available for playing via packet radio (mostly INFOCOM adventure style games). They are mildly popular...

I love the idea of a multiplayer Amateur Radio game.

I have envisioned a game where the 'plot' can evolve as players come and go... A 'game' of this type could go on for months... instead of requireing each 'player' to maintain thier involvement over the whole 'life' of the games instance... This is very intersting to think about... (and I DON'T consider myself a game player... as a matter of fact, I don't usually play 'games').

Sorry, I couldn't resist to add my 0.01 cents worth:

I have the KANTRONIX KAM... I have been 'impressed' at it's ability to copy morse code. It does a farily good job, even when the sender has a sloppy fist. Granted it is not as good as the human ear/brain combination, but I have been surprized at how well it does.

Also, the center frequency and bandwidth of the filters can be varied in 1 Hertz steps (width from about 100 Hz (or was it 70 Hz) wide, to over 2 KHz wide; center frequency also over a wide range). Its tuning indicator makes it very easy to tune in a signal even when the bandwidth is set to 200 Hz (or less).

For those who have the KAM, don't forget to place the front panel decoder switch in the 'AM' mode when trying to copy Morse code.

Of course the KAM does: CW (morse), BAUDOT, ASCII, AMTOR, NAVTEX, PACKET (both HF and VHF), WEFAX (wefax requires a computer with a graphics screen and additional software, sorry it wont display on a text only terminal).

(no, I don't work for Kantronix...)

According to Cable Network News in a Field Days report (June 1990), the
term HAM RADIO OPERATOR came about because in about 1907 there was an
article in the Home Amatuer Mechanic magazine which described how to
build a radio reciever and transmitter. Those who built and used these
radios where then call ham-radio operators.

Sure seems like it might be the correct reason. I have since wondered if
the Home Amateur Mechanic magazine changed its name to Popular Mechanics?

Bill, we plan to have our repeater autopatch call the conference bridge,
and thereby provide the audio to anyone listening with a scanner or HT
or ....

I understand that only 3 or so schools will pose questions, the remainder will
just listen in. The schools on the list are shifted up for each mission, so
eventually all will be able to talk as well as listen.

>radio is all about...

Odd, according to my tracker hack, all of the passes close to North America occur between 11pm and 7am (PDT). Now, unless they have radically changed grade and high schools since when I was a kid (not that long ago), no school will be in session in North America, and most of those kids will be fast asleep. So I fail to see a collision of interests there.

Why wasn't that schedule ever posted here? All of the AMSAT bulletins I've seen make no reference to slotting; in fact, the only references were to operation from private stations. If there are some reserved slots, it would be the proverbial Good Thing to publicise them.

>On the other hand, there's always the packet robot for those of us without a
>sked.

Such packets might be music to your ears and mine, but not to the schoolkids you'll be QRMing, as the robot and Ron are operating on the same frequency (albeit not the same time). Check out the MET schedule, and then listen before hammering at the TNC.

Observation:

What we have here is....failure....to communicate. With all of the STS35 launch attempts, some of the details have obviously slipped through the cracks. It would be a Good Thing if, in the interim, somebody were to take all the existing bulletins, integrate, filter, and amplify them.

A segment on 20/20 a few months back showed it in operation. The
car beacon is activated by a transmission from a base. (They may
use a paging frequency. ???). The beacon then transmits continously.
The police detective has a dash mounted box with a compass rose
of LEDs (looks like a doppler DF) and an alphanumeric readout
displaying the beacon ID. So monitoring the beacon frequency
can only tell you that the owner knows the car is stolen.

I admit that I did have a little problem with "noone's" until I figured that
it must be an acronym for "no one is". But we are talking about a big IF
here, aren't we?

>it or not doesn't exist on every repeater. The three I have used the
>most had 1) No
>autopatch, 2) dial 811, 3) dial 0*1, not exactly uniform here. Read

I, and probably a few others, get the impression here that you think you
must have an emergency autopatch (or any autopatch for that matter)
in order to report an emergency on a repeater. While there may be a very
isolated instance, such as cited by Bill Gunshannon, in which repeater users
would not answer a life-threatening emergency call, I believe that you can
reasonable expect repeater users/monitors to respond quickly to such a call
and place the 911 call for you. Maybe it's different out west here, but I
have never, never had a problem getting someone to make a phone call for me,
or set up a patch-- just for the asking-- for much less important reasons.

>what I say and
>then yell at me for it. Oh, and BTW, I consider myself a real ham, and
>if you're
>injured my medical training forbids me from carrying you to the
>hospital. Unless
>you like things like permanent paralysis.

I liked Bill Gunshannon's posting as a response here. Most Hams have had at
least a smidgen of training in how to handle an accident victim. I fully
understand the ramifications of moving an injured person, and how it could
result in a lawsuit in this sue-happy society; but I believe most of us would

do what we could to help. I still think making calls on police frequencies will create more problems than it solves; and I don't think it is the most expeditious method.

I remember the "SWING FISTS" on the air. They tapped out their code
in a musical way that was unintelligible as CW because the pauses
were all in the wrong places, yet consistant enough to sound sort of
like BOSSA NOVA. They were more prevalent with straight keys.

> After all of the anti-Morse flames, I found it refreshing to hear from a
> newcomer who found the code test an interesting challenge, and not something
> to be totally OUTRAGED about.

That aspect of his post was interesting. I am all for anyone choosing a challenge, and pursuing it the best that they can. But I hold just as much respect for someone who can recognize what they cannot achieve, and not wasting their own time in futile attempts. However not everyone has the ability to know exactly what they can and cannot do, and certainly no one knows these things about everyone else.

> Of course, some folks just can't sit still while an opinion like this

^^^^^^^^^^^^^^^^^^^^
> if *I* invented the code test! They usually take this misconception
> rather personally, as though to have an opinion on anything somehow
> is directed toward THEM.

There is absolutely nothing wrong with Morse Code, or as you mention in number (1), liking Morse Code.

There is also nothing wrong with having a Morse Code exam, as you mention in number (2).

However, the above two issues have NOTHING TO DO WITH the issue that has usually brought about the debate and the flames.

The outrage is in actually requiring someone to take and pass one of those
^^^^^^^(my opinion)
Morse Code tests just to get access to a controlled public resource when the code is not an essential skill to make proper use of that resource.

If you disagree with the above statement I made, then that is the difference in our opinions. The communications of these opinions is made difficult by the confusion between the different subissues. For instance, people seem to be associating:

"I like Morse Code" <==> "Let's keep the code requirement"
"I hate Morse Code" <==> "Let's get rid of the code requirement"

and these associations are TOTALLY INCORRECT. The same applies with the matter of whether or not Morse Code is easy.

I believe it is these types of issue-confusions that make not only ham radio related issues difficult to understand or resolve, but also affect major general issues like abortion, pornography, gun control, difficult to deal with.

In the abortion arena, I am BOTH Pro-Choice AND Pro-Life. These are NOT conflicting positions, but most people think they are and they are thus confused, not just on what my opinion/position is, but on what the issues are and how they relate to each other. [ask me more by email if confused]

Most of you are fully aware that my position is in favor of a "code free" ham radio license. However, that does NOT mean I am in any way against code. The term "no code" is probably THE major culprit in the many misunderstandings that have taken place in this matter. What the words mean in English does not describe the people that believe in the position that it is often labeled as.

Tad, please let us know what you do believe in; what your opinions are. Opinions themselves are not subject to debate, because they represent what you are, and that is simply fact about you. What could be subject to debate are the facts you might use in support of your opinion. Some might believe the fact to be in error, or that they do not apply. More often there are many facts tugging the issue in many directions, and the weights we apply to each are the big differences. Those who disagree with your opinions might believe you based them without the benefit of fact. If you want to do that, that's your right. If you have used facts and logic as your basis, stating them can preempt debate on lack of facts.

There is probably no way to avoid any debate as long as a difference of opinion exists. Some of us are hoping to converge on a common understanding. That is possible even with no change in opinion.

--Phil Howard, KA9WGN-- | Individual CHOICE is fundamental to a free society
<phil@ux1.cso.uiuc.edu> | no matter what the particular issue is all about.

>fine on all other bands.
>
> Y.N. Miles,

I've found that my venerable TS-520 doesn't have a very wide range for
loading on the lower bands - can't match much beyond 3:1 at full power.
If your antenna is wildly nonresonant on 40 and 80, the pi network may
not be able to match it.

I don't know what C26 is, but assume it is part of the LOAD capacitor
that gets switched in for 40 meters. It's true that a hi VSWR could
exceed your 500 wvdc - there are some equations relating SWR to voltage
peaks (but I forget). Try loading up on a dummy load - if C26 is really
blown, the LOAD knob won't be centered at full load, or you may not be
able to load at all.

If the 40 meter antenna is nonresonant, you might want to invest in a
Tuner. I've had some luck with the MFJ-949C, except that the switch
isn't really rated 300 watts - it's ok at 100 watts, though.

> your rig?) and either dil 911 directly or have someone do it. That way, you
> won't have to explain your call. If you make an unauthorized call, you will
> spend a lot of time explaining to the dispatcher, or whomever, who you are,
> and why you're calling them directly. If it's precious seconds you're try-
> ing to save, you surely won't do it this way. And if it's *my* life you're
> trying to save please don't use this means. By the time you get through the
> hassle I'll probably have been carried to the hospital by a real Ham.

1. Not all repeaters have autopatches.

2. Sometimes no one is on frequency who can call for you.

3. Sometimes some windbag is on the frequency.

4. If you do get someone calling for you, there is the added delay and distortions of them relaying messages back and forth. The operators on each end (The ham on site and the dispatcher) don't get the benefit of direct contact, such as detecting levels of stress.

If I have my IC-32AT with me, I can be on the local fire/rescue/medical frequency in just 3 seconds.

I believe that if you *DO* follow the standard procedures that they use on the radio, the dispatcher is more likely to sooner accept the communcations as that of an authentic emergency. The procedures work to save time as well. But if you don't know them, don't try to fake them. The dispatchers are trained to deal with communications with ordinary people as well, though it would be over the phone on a dedicated full duplex communication line. For that reason, simplex autopatches can be a problem as well. Using ordinary phone communications procedures over the radio can end up tying up the frequency which might be needed to actually dispatch the rescue.

If you find you must use such a frequency, I believe the following would be good advice:

0. Don't panic.

1. Give the dispatcher some sort of handle to call you by, so they can ask you to get back on frequency when they have a question to ask you. Do NOT give your ham call as this handle because it is not something they are readily prepared to deal with (unless you get LUCKY and the dispatcher is a ham). A good simple handle could be "ham operator".

I happen to have an agency code and number they are familiar with and plan to use that.

2. BEFORE you get on the frequency, make an assesment of the situation. Know the LOCATION and the number and types of injuries. If we are talking "mass casualty" still give them NUMBERS. Estimate if you must, but numbers are important.

3. When you get on the frequency, address the dispatcher as everyone else does, give your "handle" and indicate you have "emergency traffic" or "an emergency situation" or whatever it is.

4. Let THEM handle the radio procedures such as clearing the frequency. Once you make contact, stay off the radio unless called or there is an important change in the situation. If you call them, address them in the usual manner and let them acknowledge you or as their common procedures go.

1675. Mods for Kenwood TM-411A?

Newsgroup: rec.ham-radio
Date: 1990-10-04 22:47:02 UTC
From: depolo@eniac.seas.upenn.edu
Message-ID: <30612@netnews.upenn.edu>
Source record: 7987

Does anyone know of any mods for the Kenwood TM-411A? In particular,
expanding receive coverage from 438-450 MHz to 430-450 MHz, or even
wider? There's one obvious problem - it only has a '1s' MHz digit
and uses a small LED to indicate the 43x MHz range.

> There is one problem with getting an S-line, and it won't get any
> better: tubes....

The other problem is if you get a 32S? or 73S? with a worn out
PTO or a bum rotary switch. I spent several days in grad school
replacing these switches -- you know, the switched with 6.02 x 10**23
contacts.

The Purdue ARC had wisely ordered new replacements from Collins
in the mid 1970s. Even then they were expensive, and they sat
in the closet for a few years waiting until for installation.
I drew a complete wiring diagram for each switch (noting wire colors)
before snipping the first wire.

It took a lot of work, but was somehow worth it. Those S-Line radios
just oozed quality.

My personal CW receiver preference was for the Drake R-4C over the 75S3
series, but I liked the Collins 32S transmitter over the T-4XC due to
ease of tuneup and a fondness for 6146s.

[paramedic mode on]
While I think that it's great that the patients survived, reading this
produced only one thought:

PLEASE DON'T REMOVE PEOPLE FROM WRECKED CARS!!!!!

Doing so without proper training can make whatever injuries the patient has
much, much worse. It's far better to leave them wherever they are until
trained personnel can stabilize them and move them safely. The only time you
should move an injured person is if they are in immediate danger, like the
car being actually on fire, or about to slide off of a cliff. Note that
merely leaking fluid does not mean the car is in immediate danger; more
often than not, that fluid is radiator coolant or battery acid. Cars simply
don't blow up like they do after every accident on TV. If in doubt, DON'T.
[paramedic mode off]

Having said that, I agree: that kind of thing is what ham radio is all about.

1680. VE Responsibility (was RE: Code Test Gimmick)

Newsgroup: rec.ham-radio
Date: 1990-10-05 00:34:14 UTC
From: rlwest@flopn2.csc.ti.com
Message-ID: <9010050034.AA03784@tilde>
Source record: 8008

There have been numerous comments lately about disputes with VEs. In particular, whether the VE should allow "writing down dits and dahs" for later translation for the test answers.

The more serious issue is lawsuit resulting from improper testing.

WHO AM TO HAVE AN OPINION, AND EXPRESS IT SO VERBOSELY?

I am an active member of the VE team with Texins Amateur Radio Club (Dallas, Texas). We're under the sponsorship of the W5YI-VEC. In regard to disputed testing methods, I feel it is my duty to KNOW what is legal and proper. If something comes up that I DON'T know, I'd better be finding out, and fast.

Our VE Team Leader (Contact VE) is Bill Warner, KB5F, and I trust his knowledge and leadership, but I would not be embarassed to contradict him if I could back it up. (However, I've found he's usually right--he does his homework!) We have about a dozen hams in our club who are VEs and they all pitch in.

Dallas is rich in ham population and ham clubs, and you can find a VE session almost any weekend. I realize other parts of the country are not so "blessed", and VE teams and ham clubs are few and far between.

MY OPINION (AS A VE TEAM MEMBER) ON WRITING DOWN DITS AND DAHS

This has not been an issue in our testing, and I've never seen anyone try it. I am not prepared at this writing to voice an opinion on whether it should be allowed, having not fully researched it. However, I (IMHO) believe that it should preclude one of the two methods for grading, namely solid copy.

Remember that the ten question test is only one of two ways to pass the code element. We have had a number of applicants who have just missed the 70% but have had a solid minute of copy.

Although I would not encourage it among the code students I coach, I am not sure that I could preclude it in the exam. I would want to re-read the rules and make sure I understand the wording, and ask some other VEs for their interpretations.

PART 97 AND VEC GUIDELINES

The VEC prints and distributes the rules and procedures for examinations.

As good a job as the VECs (or the FCC, even) might do on writing rules or guidelines, there is always the possibility for missing some situation. This is where a VE team must make a decision. An informed decision is necessary, within the given guidelines of the program.

If something that is NOT covered in the guidelines comes up, the VEs will use their best judgement, but the responsibility doesn't stop there. In some cases, the right answer is to take NO action, until better information is available.

An arbitrary ruling, subject to widespread and emotional dispute, could conceivably have repercussions and be damaging to the entire VE program.

Although the VE team members are knowledgable, the DO NOT MAKE POLICY. Any "rule" I state, I must "back up" with either the FCC Part 97 or the Sponsoring VEC's guidelines.

HANDLING PROBLEMS

Because I feel that part of the "mission" of the VE program is to HELP the applicant get as much of a license as he/she can legitimately qualify for, if there is a question that could not be resolved at that time I (personally) would make all reasonable attempts to

* find a definitive answer in a timely manner,

We have Part 97 and the W5YI-VEC guidelines on the test site for just that reason.

We also have W5YI's phone number, if it needs to go that far. Fred Maia does a phenomenally big job in supporting lots of VE teams. If a dispute looked as though it might become a significant one, I would want him involved as early as possible.

* provide alternative testing for the applicant whose test could not be completed.

If the issue could not be resolved "on the spot" to everyone's agreement, then at least we need to "agree to disagree" and plan for resolution.

Just because the VE Team has Monthly Exam Sessions, we are not limited to them. Special exam sessions can be held at any time for any reason. They must be made open to the public, and reasonably advertised, but nothing in the VEC rules precludes additional sessions.

RESOLUTION OF QUESTIONS OR DISPUTES

One reason THREE Volunteer Examiners are required is to help "fill in the gaps" due to relative inexperience or indecision. Also, two examiners can be deadlocked, three, less likely.

* In the event of dispute in interpretation of the rules or grading, I would first check the documentation on hand.

For example, what's the EXACT wording about the code exam? The phrase "copy by hand" does not do it alone. "In English" may not do it alone. You MSUT NOT quote the rules out of context.

* I could also ask other VE teams.

Maybe they've had the problem come up already. What did they do? Did they find a written ruling? Did they ask the FCC? Is it resolved?

* If we cannot resolve the problem that way, the next resource is the VEC.

Whether it's the ARRL, DeVry, SoCal, W5YI, or any of the other VECs around the country, I would first ask my own VEC, but would not be shy about contacting one of the others for a "second opinion," especially on issues that might be controversial.

BY THE WAY, YOU ARE NOT EXCLUDED FROM FINDING OUT

A test applicant should not be shy about contacting, first, some other hams, then, a different VE team.

If an applicant felt, sincerely, that examinations were being improperly conducted, he/she should proceed. The VECs publish their phone numbers and addresses. They are also often represented at larger hamfests.

WHAT IF I DON'T LIKE THE ANSWER?

I personally do not believe that the final resolution is that the "dit-dah" approach must not be used.

Would that mean you must also preclude someone from taking SHORTHAND?

Personally I would not, but I could not grade it for solid copy. (I don't speak shorthand!) Should a similar approach be taken to an applicant writing down the dits and dahs?

(My writer's electronic companion complains about the frequency of the word "personally" here. I want to make it clear this part is my own opinion and does not represent the FCC rules or VEC guidelines. Personally, I think this software is too picky.)

If the overall opinion (all the VEs and VECs and FCC and so forth) think so, then that's the rule of the game. But rules were made to be (no, not broken) changed. If you feel strongly enough about it.

And if you feel strongly about it, you can champion the cause, spend a lot of time and effort to engage the agreement of other hams and VEs and VECs and you still may not get your way.

Or, as someone suggested, you can go to court. There, you ask someone who knows little or nothing about amateur radio make rules that affect amateur radio.

IS LAWSUIT THE ANSWER?

I certainly hope not. If any applicant anywhere ever brings a VE into court, and the case is NOT thrown out for being frivolous, I will turn in my VE card and never sign another CSCE or the back of another 610.

It's not worth the risk. If you are volunteering to do a service, and you do a reasonable job of being aware and competent, and are doing it because you care about the hobby (that very word is significant) and still some wiseguy can haul you in because he didn't like the way you do things, that takes all

the fun out of it.

I think if it ever happens, I will be saved the trouble, however, because the FCC will simply hold up a hand and say, "that's all!"

The VE program is (IMHO) a Good Thing, but it is precariously balanced on our Good Behavior. The FCC doesn't have the time or budget to be bothered. I would not blame them.

FOR WHAT IT'S WORTH

Rarely do I get on the soapbox quite this much, but I do believe in the VE program, and all this stuff I've said above.

That's my opinion, for what it's worth. If you are still here, and haven't hit "delete" yet, you probably have an opinion of your own, and if you don't feel like posting it, E-mail it to me directly. I am interested in what you think, it's why I read this newsgroup in the first place.

If I've stepped on any toes, I'm sorry, nothing personal, I'm just saying what I think, and am now braced for any flames, jabs, jibes, or whatever.

Actually, I hope you DO have an opinion, and are willing to express it.

As far as I'm concerned, that's what makes ham radio fun.

Have a nice day.

To the person who could hit 14 repeaters, yet couldn't access the patch:

SHAME on you for not finding out what repeaters have 911, and how to access it! It is easy to find out the 911 emergency codes for almost every repeater in the state of Hawaii. If you don't know exactly what it is, everyone has nearly standardized on one of the following:
911, *911, or *9.

It wasn't anyone else's fault for not sitting around waiting for you to have an emergency... it was YOURS for not getting the information ahead of time. What do you use 2 meters for? Haven't you talked on any repeaters at all? Most clubs publish these codes in their newsletters. Are you in any clubs?

Sounds like you don't use 2 meters much. If you don't put out any effort to be prepared, don't blame the rest of us when you aren't prepared.

Information on the Amateur Operators Certificate
Examinations

RIC-24
Issue 2
July 1, 1990

Communications Canada
Radio Regulatory Branch
300 Slater Street
OTTAWA, Ontario
K1A 0C8

_G_E_N_E_R_A_L _I_N_F_O_R_M_A_T_I_O_N

The hobby of amateur radio, today more than ever, is an
extension of scientific knowledge applied to telecommunica-
tions. The Department of Communications believes that ama-
teur radio should be accessible, so that those who are
interested in the science and art of radiocommunication may
avail themselves of every reasonable opportunity to learn,
enjoy and contribute to its progress.

The department also recognizes the necessity for ama-
teur operators to have some technical and operating
knowledge before being allowed on the amateur radio bands.
This circular outlines basic information for individuals who
wish to become amateur radio operators.

Anyone may become an amateur radio operator; there are
no age or nationality restrictions. The best way to learn
about amateur radio is to enroll in a class taught by ama-
teur radio operators or clubs. Information on these courses
is available from the three amateur associations listed

below. Study guides, question banks, technical books, Morse code tapes and other publications relating to amateur radio, are available from these organizations for a fee.

Canadian Amateur Radio Federation

While the scope and depth of the knowledge required are described on the following pages in general terms, the exact requirements for the various qualifications can be obtained by referring to the appropriate bank of questions.

Anyone may use an amateur radio station, provided a qualified operator is in attendance to pertorm the control functions. Getting to know radio amateurs in your area and practising on their stations is an excellent way to learn about operating practices, station assembly, regulations, radio frequency propagation, antennas and a host of directly related data.

_C_E_R_T_I_F_I_C_A_T_E_S _A_N_D _P_R_I_V_I_L_E_G_E_S

There is only one certificate available for the amateur service: the Amateur Operator's Certificate. The holder of this certificate may obtain as many as four levels of qualification. The Basic Qualification is required before an individual may operate an amateur radio station in Canada or hold a licence for such a station. The following paragraphs describe how to obtain each of the four levels of qualification and the privileges accorded to those who have reached these levels.

_P_L_E_A_S_E _N_O_T_E that no operating privileges are accorded the holder of the Morse Code Qualifications (5 w.p.m. and 12

w.p.m.) or the holder of the Advanced Qualification unless the holder also possesses the Basic Qualification.

_B_a_s_i_c _Q_u_a_l_i_f_i_c_a_t_i_o_n

Basic Qualification provides the foundation for operation in the amateur radio service. To obtain the Amateur Operator's Certificate with Basic Qualification, a candidate must successfully complete a theory/regulations/operating procedures examination.

The holder of the Amateur Operator's Certificate with the Basic Qualification may:

1. operate on all frequencies above 30 MHz, using all classes of emissions,

2. use a maximum of 250 watts DC transmitter input power, and

3. build and operate all station equipment except for "home-made" transmitters.

_M_o_r_s_e _C_o_d_e (_5 _w._p._m.) _Q_u_a_l_i_f_i_c_a_t_i_o_n

The examination for this qualification requires the candidate to be able to send and receive Morse code at a speed of not less than 5 words per minute.

The holder of this qualification enjoys all the privileges granted to those who have reached the basic level of qualification. In addition, he or she may operate in all amateur frequency bands below 4.0 MHz, using all classes of emissions.

_M_o_r_s_e _C_o_d_e (_1_2 _w._p._m.) _Q_u_a_l_i_f_i_c_a_t_i_o_n

The examination for this qualification requires the candidate to be able to send and receive Morse code at a speed of not less than 12 words per minute.

The holder of this qualification, in addition to the basic privileges, may operate on all amateur frequency bands below 30 MHz, using all classes of emissions.

_A_d_v_a_n_c_e_d _Q_u_a_l_i_f_i_c_a_t_i_o_n

Advanced Qualification is for those individuals who have an in-depth knowledge of electronics, a good knowledge of the various types of amateur equipment and an understanding of the functioning of circuits that will enable them to

make repairs.

The holder of the Advanced Qualification, in addition to the basic privileges, may:

1. build and operate transmitting equipment,

2. use maximum transmitter power of 1000 watts DC input,

3. sponsor repeaters and club stations, and

4. remotely control fixed stations, including the use of radio links.

_E_X_A_M_I_N_A_T_I_O_N _R_E_Q_U_I_R_E_M_E_N_T_S

October 4, 1990

- 4 -

_B_a_s_i_c _Q_u_a_l_i_f_i_c_a_t_i_o_n

The theory questions in the Basic Qualification examination require basic component analysis. Other subjects are examined at the concept or system level, rather than at a detailed circuit analysis level.

_B_a_s_i_c _E_l_e_c_t_r_o_n_i_c_s

Candidates must:

1. understand the basic concepts and relationships of conductors, insulators, direct current, alternating current, electromotive force, resistance, power, capacitance, inductance, reactance, impedance and resonance;

2. be able to define Ohm's law and be able to do simple calculations using it;

3. be able to explain the function of a battery, a transformer, an AC power supply, and the basic blocks of a simple transmitter, receiver and transceiver; and

4. be able to identify diodes, transistors, integrated circuits and vacuum tubes, as well as the circuits for which they are used, and be able to describe their basic purpose.

_P_r_o_p_a_g_a_t_i_o_n _a_n_d _A_n_t_e_n_n_a _S_y_s_t_e_m_s

Candidates must be able to describe:

- sunspots, sunspot cycle, solar radiation, ionosphere, fading, absorption, refraction, radiation

angle, multi-hop, MF/HF propagation, VHF/UHF propagation, transmission lines, antenna types, antenna impedance, standing wave ratio (SWR) and matching devices.

_I_n_t_e_r_f_e_r_e_n_c_e _a_n_d _S_u_p_p_r_e_s_s_i_o_n

Candidates must be able to:

1. describe and give examples of how to suppress front-end overload, audio rectification, harmonics, parasitics and intermodulation products;

2. explain the use and be able to show placement of low-pass, high-pass, band-pass and band reject filters; and

3. explain the purpose of shielding and how it is

accomplished.

_S_t_a_t_i_o_n _A_s_s_e_m_b_l_y

Candidates must be able to:

1. explain the basic function of transmitters, receivers, transceivers, SWR bridges, power supplies, fuses, operational control settings and interconnecting cables;

2. explain how to achieve good grounding and lightning protection; and

3. show the proper position in relation to one another of the various pieces of equipment that may be found in an amateur radio station.

_O_p_e_r_a_t_i_o_n_s, _P_r_o_c_e_d_u_r_e_s _a_n_d _R_e_g_u_l_a_t_i_o_n_s

Candidates must:

1. be able to explain operational procedures for voice radiocommunications, Morse code transmission of messages, RTTY, AMTOR, packet transmission, repeater use, slow-scan and fast-scan television, as well as other modes of operation;

2. be able to explain the international and domestic regulations governing the operation of an amateur radio station;

3. demonstrate a good knowledge of the Q code signals described in Radiocommunication Information Circular 25 (RlC-25), which contains extracts from the Radio Regulations of the I.T.U., the Radiocommunication Act, and the General Radio Regulations, Part II, affecting the Amateur Service; and

4. be able to recognize the emergency signals and indicate what procedures should be followed in their use (distress and urgency).

_M_o_r_s_e _C_o_d_e (_5 _w._p._m.) _Q_u_a_l_i_f_i_c_a_t_i_o_n

Candidates must demonstrate their ability to send by hand and receive by ear, international Morse Code at a speed of not less than 25 characters per minute (Swords per minute) for a period of not less than three consecutive minutes.

_M_o_r_s_e _C_o_d_e (_1_2 _w._p._m.) _Q_u_a_l_i_f_i_c_a_t_i_o_n

Candidates must demonstrate their ability to send

by hand and receive by ear, international Morse Code at a speed of not less than 60 characters in one minute (12 words per minute) for a period of not less than three consecutive minutes.

_A_d_v_a_n_c_e_d _Q_u_a_l_i_f_i_c_a_t_i_o_n

This examination focuses on circuits and components, rather than on systems.

_C_i_r_c_u_i_t _A_n_a_l_y_s_i_s

Candidates will be expected to explain the use and operation of: oscillators, radio frequency amplifiers, buffers, multipliers, mixers, intermediate frequency amplifiers, detectors, discriminators, audio frequency amplifiers, filters, speech amplification and processing as well as power supplies and regulation.

_T_r_a_n_s_m_i_t_t_e_r_s, _R_e_c_e_i_v_e_r_s, _L_i_n_e_a_r _A_m_p_l_i_f_i_e_r_s _a_n_d _M_o_d_u_l_a_-
_t_i_o_n _T_e_c_h_n_i_q_u_e_s

Candidates must be able to:

1. describe transmitting, receiving and modulating principles for the following: continuous wave, single sideband, ACSB, AM, FM/PM, pulse, fast-scan and slow-scan television, RTTY, AMTOR, packet,

translators, repeaters and satellites;

2. explain the terms sensitivity, selectivity, stability, noise figure and dynamic range;

3. explain in detail direct conversion and superheterodyne receivers; and

4. describe the use and operation of class AB1, AB2 and B linear amplifiers and class A and class C amplifiers.

_P_r_o_p_a_g_a_t_i_o_n _a_n_d _A_n_t_e_n_n_a _S_y_s_t_e_m_s

Candidates must be able to describe in detail:

- ionospheric layers, sporadic "E", aurora borealis, meteor scatter, EME transmission, tropospheric bending, VSWR, baluns, matching networks, transmatches, coaxial cables, balanced lines, velocity factor; dipole, Yagi quad and trap antennae; grounding, groundplane, virtual height, radiation resistance, mirror image, and other propagation-related information.

October 4, 1990

_T_e_s_t _E_q_u_i_p_m_e_n_t _a_n_d _C_o_n_s_t_r_u_c_t_i_o_n

Candidates must be able to explain the use or function of:

- multimeters, VSWR bridges, marker generators, frequency counters, dip meters, two-tone audio generators, dummy or artificial antennae, oscilloscopes, signal generators, attenuators, spectrum analyzers, and other test equipment.

_C_E_R_T_I_F_I_C_A_T_E _E_X_A_M_I_N_A_T_I_O_N_S

If candidates wish to be examined for the Basic or Advanced Qualification or to take the Morse code examinations given by a radio inspector, they must make an appointment at any district office of the Department of Communications. Some district offices prefer to give the examination at a school or meeting hall, especially when a group, such as an amateur radio class, is involved. However, small groups and individuals are usually examined at the local district office. A fee of five dollars ($5.00) is charged for each qualification when the examination is given by a department official. To find the district office nearest you, please refer to your telephone directory.

Where necessary, examiners can help and make special arrangements for candidates who have physical disabilities. It is much easier for all concerned if such requests are made when the appointment is made.

When an examination is failed because the candidate's language is neither English nor French, or because academic limitations restrict the ability to read the questions properly, an oral examination may be administered. A decision of this nature can be made only by a radio inspector.

Private groups, such as amateur clubs or organizations, may also give amateur certificate examinations. The department recognizes that when such private groups give the examinations, costs are incurred since they must procure facilities and provide the necessary services. The department understands the need to recover costs, but wishes to underline that these charges are not levied on behalf of the department.

_W_R_I_T_T_E_N _E_X_A_M_I_N_A_T_I_O_N_S

For a written examination, each candidate will be supplied with a booklet containing the questions, formulae as required, and an answer sheet. The candidate must supply name, address and other related information. The candidate may use mathematical tables and/or a non-programmable calculator to complete the examination, but these will not be

supplied by the examiners.

Before the examination begins, the examiner will allow a few minutes for briefing purposes. After the examination begins, no questions will normally be permitted. The pass mark is 60 percent.

_B_A_S_I_C _Q_U_A_L_I_F_I_C_A_T_I_O_N _E_X_A_M_I_N_A_T_I_O_N

The examination is comprised of 100 multiple choice questions. At least 25 of these are based on domestic and international regulations; the remainder on test theory and operating procedures.

_A_D_V_A_N_C_E_D _Q_U_A_L_I_F_I_C_A_T_I_O_N _E_X_A_M_I_N_A_T_I_O_N

This examination consists of 50 multiple choice questions based on advanced radio theory.

_M_O_R_S_E _C_O_D_E _E_X_A_M_I_N_A_T_I_O_N

The Morse code examination is in plain language and may include the twenty-six letters, the ten numbers, punctuation

marks (comma, period, question mark, dash and fraction bar), Q-signals and emergency signals. In both the sending and receiving examinations, each character omitted, incorrectly sent or received, is counted as one error. A mark of 100 percent is awarded for five errors or less, 99 percent for 6, 98 percent for 7, 97 percent for 8, etc. The examiner will allow two minutes for candidates to review and correct their copy before it is graded. The pass mark is 100 percent.

A candidate writing the exam for the Morse Code (12 w.p.m.) Qualification, who does not already have the Morse Code (5 w.p.m.) Qualification, will be awarded the Morse Code (5 w.p.m.) Qualification without further examination if a mark of over 60% (fewer than 45 errors) on both sending and receiving is achieved.

Delegated examiners are available in many areas to give the Morse code and written examinations. They may be contacted through amateur radio clubs, technical schools and other organizations. Information on delegated examiners and copies of Radiocommunication Information Circular 1 (RlC-1), Guide for Delegated Examiners, are available from your local district office of the Department of Communications.

_M_I_S_C_E_L_L_A_N_E_O_U_S

Existing amateurs who hold the Amateur Radio Operator's Certificate or the Amateur Radio Operator's Advanced Certificate are deemed, by regulation, to hold the basic, Morse code (12 w.p.m.) and advanced levels of qualification. Those

who hold the Amateur Digital Radio Operator's Certificate are deemed, also by regulation, to hold the Basic and Advanced Qualifications.

Any person holding a Canadian Radiocommunications Operator's General Certificate, a Canadian Radio Operator's First Class Certificate or a Canadian Radio Operator's Second Class Certificate may apply for a licence, good for all qualifications and privileges, without further examination. Any person holding a Canadian Radiotelephone Operator's General Certificate, (Aeronautical, Maritime or Land), may apply for a licence without further examination, but privileges are limited to those of the Basic Qualification.

A candidate for the Amateur Operator's Certificate examinations may be examined for any qualification, in any

order, but candidates may not apply for a licence until they have passed the Basic Qualification examination.

As previously mentioned, many amateur clubs and organizations provide instructional classes for individuals interested in becoming radio amateurs. In general, the instructors giving those classes will provide candidates with all the information they need, as well as the necessary study guides. Candidates, however, will have to devote time to study outside class, the amount of which will depend on their level of knowledge and their learning skills.

Most instructors giving radio amateur classes will distribute copies of this document, as well as the Radiocommunication Information Circulars listed below. However, candidates may also obtain, in limited numbers, copies of these circulars from any district office.

RlC-1 - Guide for the Delegated Examiners

RIC-3 - Amateur Service

1. Countries that Forbid Amateur Radiocommunications

2. Countries with Which Agreements or Arrangements Have Been Concluded to Permit the Exchange of Third Party Traffic

3. Countries with Which Reciprocal Operating Privileges Have Been Arranged

RlC-25

1. Radio Regulations of the I.T.U.

2. Radiocommunication Act

October 4, 1990

3. General Radio Regulations, Part II, Affecting the Amateur Service

Well, I don't exactly live and breath amateur radio. The main reason
that I am an ARRL member is to get QST, and to keep up on new
regs from the FCC. I don't work HF - mostly 2M with my wife. (I also
read the net regularly and subscribe to too many magazines).

There are some things that I am concerned about. One of the main ones
is restrictive covenents against radio antennas in housing developed during
the last 10-20 years - an issue that is preventing many people from
considering amateur radio as a hobby who otherwise have the resources to
consider it. Since I am not even close to retirement age, this is
a problem that may be unique to my age group. Is the ARRL doing anything
about it? Nope. But will they promote more contests that inspire
some to expend large amount of money to go to barren islands so that
others can interfere with each other and make the bands useless for other
uses? Yep. Will they spend a large wad of cash for a shortwave
broadcast station, then come to the membership with hat in hand looking for
money for WARC-92 funding? You bet.

Dave Ritchie N4DJS

David.Stark@f218.n260.z1.FIDONET.ORG (David Stark) complains:

FWIW, I have been an ARRL member since 1981 (my first year
licensed) and have just renewed my own membership. I am annoyed at
the Board minutes in last month's issue detailing the creation of
several new paid staff positions at HQ. I don't recall being asked if
I wanted to hire anybody else.
If somebody can point out a reference in QST where members were
asked in advance about adding more salaries to the ARRL budget,
please do so. I will then take a hunk of humble pie into my library
to read it.

73 de Dave, NF2G

Well, what's the alternative? You want them to mail a letter to each of,
what, 200000 members to ask about it? They'd have to supply the return
postage, otherwise you'd complain about that, so 200000 round-trips is
about $100,000 spent polling the members about a (guessing) $20,000 job
at ARRL HQ? It's like electing a gumment and then complaining about what
they do once they are in power (I know, there's no opposition party in this
case, but we vote for the guys that make the decisions).

And anyway, how can you *read* humble pie? (a low blow, admittedly...)

Query: The location of any fusible links, or diodes used as such.

I'm hoping someone in net land can help me with this, as there are a few at least out there with some cardnial knowledge on Bendix/King handy talkies, as the manufacturer obviously enjoys the right to not make such details known to the general electronics populus.

(As near as I can tell) I tapped 2 contacts on the 8 pin port of a Bendix/King HT while releasing 2 contacts used for programming. The Bendix went to sleep; But I don't think any IC went, as it plain shutdown, no brain damage noted. (Tones, faulted display, gentle smoking, etc)

I was told there was a thin wire used as such a fuse, nothing found matching that idea, the battery pack is fine, and the circuty from the battery to switch (as well as PC board) is complete. I haven't located any part matching the stadard Buss surface mount fuses. (Yes, the whole radio is surface mount components, double sided boards, populated on both sides, IE Simple Repair Hell.)

While I'm on the subject, anyone know of any modifications to this radio, or keypad & non-standard programming tricks (like holding keys at powerup, like many 2m HTs?)

It might be instructive to consider a slightly different situation.
You come upon a car accident involving a police car where the officer has
been knocked unconscious. Do you reach into the police car, grab the mic,
and call for help on the police radio?

My answer is NO, if I have two meters available, and YES if there is no
other means of communication handy.

I think the bottom line is: Is this such a dire emergency that it will be
worth it even if I get into trouble for it?

A couple months ago, I posted a request for a VOX circuit. I would like to thanks those who helped me find that info I was looking for.

I am now looking for a used FM band exciter (88-108 Mhz) and a stereo generator or schematic and construction information for such devices. Used devices would have to be cheap and working. The schematics would have to be solid state and of recent vintage. ANY help would be appreciated! You can mail any info to:

P.O.Box 1286
Lakewood, NJ 08701

Thanks!

A frequency counter and/or an RF Field strength meter wouldn't do a car thief
any good. As mentioned in previous articles, LoJack ISN'T activated UNTIL
the owner of the car finds his/her car stolen. Often, this can be several
hours.

Since the system isn't activated, it wouldn't be sending out ANY
RF (not from LoJack anyway....)

I too am curious to know how the LoJack transmitters are activated.
I know the 173.075 Mhz freq is the "beacon" frequency. I am wondering
if they use the same freq. for activations.

Cross-posted to: rec.ham-radio.swap,rec.ham-radio

I am looking for general coverage transmit mods for both the Kenwood TM-621
and TM-731. The mod for the 621 is a specific one. The 621 will transmit up
to 151.995 with the mere CAP mod. I am in search of the mod to go above
152 (to about 155.00 MHz). Now I am aware the the 721 will go the full swing
when 2 shorts are applied to the board which is behind the front panel.
I have attempted this same mod to the 621 and it does not work at all.
If anyone knows if the shorts are different in the 621 or of another
process to extend it I would appreciate it.
With regard to the 731, I am interested in the mods for both UHF and VHF.
Any other mods would also be appreciated. If you can help me, please
contact me here or at PO Box 1286
Lakewood, NJ 08701

Many thanks, Chris

How wonderful it must befor all the parochial types that have a local repeater and are initiated in the secret access codes of the autopatch. But there is one thing that the amateur radio service does not have, despite all the saving lives chatter. Funny though cos CB has it, as do ships and aircraft.

What do we lack? A distress frequency. One that works across the U.S., so if I fall in a hole in Chicago I can get help without having to make friends first.

I bring this up every now and again and am usually ignored. Kinda nice to know though that my pilot doesn't have to look through his Jeppesens to find a tower freq when the plane starts making funny noises. Must be comforting for ships' officers too not to have to try and read the pilot as waves crash across the bow and flames leap up the superstructure. Those sailor boys even got a Morris distress freq - Now there's an idea that might catch on.

Yours, probably the only amateur without a local repeater where they talk to me.

I agree with what Jay is saying and heartily respect his opinion, especially considering that he is an EMT. However, I guess I should have mentioned in my original post, that the guy that stopped is a volunteer fireman, and is also involved with the Camden County emergency rescue squad. I'm not exactly of what training he has, but I do know he has the background. I wish I could remember his call - N3GX? - in any event, he did the right thing in the situation, fortunately for all involved.

I stand corrected. That's what happens when you get second-hand info.
Apparently the trigger frequency is in the 900 MHz band, but the
continous beacon is on VHF. Does anybody know the format for the
beacon? Is it a continous signal, does it have any sort of a vehicle
ID transmitted, etc? It would be fun to leave the scanner on this
frequency to listen for activity.

1695. 2M HT's and intermodulation.

Newsgroup: rec.ham-radio
Date: 1990-10-05 11:07:03 UTC
From: PJML@ibma.nerc-wallingford.ac.uk
Message-ID: <05.Oct.90.12
Source record: 7832

It continues to amaze me how the makers of HT's fail to provide them with adequate front-end selectivity; i was recently looking to buy a simple (Cheap!) 2-meter HT, and *NONE* of the various ones i trialled in the dealers seemed immune to 'squawks'. It generally seemed that 'the more features, the worse the RF performance'. One, which shall remain nameless, suffered terminal intermodulation on a 1/4 wave whip.....

What *is* the point on providing sub-microvolt sensitivity if the thing dies laughing at anything over a millivolt? Maybe if the designers of these radios were forced to use them in a real environment (one with more than one transmitter!) they would change their mind.
Get the designers out of their shielded RF test-environments and into a big city full of nasty, intrusive RF.
Why install scanning etc. on a radio when the squelch is kept open *ALL THE TIME* by garbage from the local paging TX?

p.s. in the end i bought an ex-commercial HT; it suffers no ill effects on receive, even when i am transmitting on the same band...

Eat your hearts out Yaesu, Kenwood, Icom, I am sticking with Motorola from now on.

p.p.s. a HT220 can be used to club muggers, AND it will still work as a radio afterwards...

1696. KISS PROMS for Ashby TNC

Newsgroup: rec.ham-radio
Date: 1990-10-05 12:52:50 UTC
From: jhk@SATURN.ACC.COM
Message-ID: <9010051252.AA09225@saturn.acc.com>
Source record: 8007

Subject: KISS ROM set for Ashby TNC

Several years ago I purchased and used an Ashby TNC when packet radio was just starting up. In the environmental spirit of things, I'd like to recycle the unit and continue to use it with a more modern networking system (e.g., the KA9Q NOS package).

In one of the earlier versions of the KA9Q documentation, there was a reference to using (and I'm loosely quoting here) "... the HAPN/Ashby board..." which I presume both used the Intel 8273 for HDLC framing.

Does anyone have information on whether there was ever a KISS ROM set for the Ashby board, and if so, is there anywhere that I can get a clone of it, or the hex listing to blow into a PROM ?

I'd appreciate any info on the subject matter someone might know. Responses can be either to the mailing list or to:

jhk@saturn.acc.com

Thanks very much.

I was a radio operator qualified in Morse Code when I was in the military
many moons ago. I went to the school twice over a long period of time.
The requirements in the army were not that high unless you showed aptitude
and got grabbed by the spooks. But as an interesting point as far as
who can and can't learn the code, the failure rate was better than 50%
and when you figure this was during the peak of Vietnam and the alternative
for a draftee who didn't make was straight into the Infantry, it appears
that even with a lot of incentive, a lot of people can't really do it.
By the way, 10WPM was enough to graduate from the school. If you were
good, they didn't hold you back and they did have qualifiers for people
who topped 20 WPM.

|>technical advancement, and international good will are what this
|>hobby was founded on. Let's keep it that way. [...]

Yes, there's every reason to feel good about the hobby/service when something like this happens. However, there is no need to try and justify the feeling by knocking other people's passtimes. All the different sub-hobbies in ham radio have a right to exist and be valued for what they are. Not everyone has to do the same thing, and, in fact, it would be a pretty bad thing if they did.

It's possible to promote the good parts of radio simply on the basis of thier goodness. There's no need to put down other parts of radio.

>
>I'd recommend getting the 32S-1/75S-3 combination. The newer models have
>a few additional features, but they're not worth the almost double price.
>(I've been told the S-line is very popular in Japan and the Japanese
>hams have driven the prices way up).
>
For serious CW work, avoid the 32S1 like the plague!!! It used the sidetone to key the transmitter, and does <not> have a good cw note. The 32S3 is a far better rig for CW work (as well as being several years newer).

The receivers are all good. Some folks think the 75S1 is actually a bit better on 80 meters than the newer receivers, but it's not as hot on the higher bands.

Another minor correction to Jerry's comment: the 75S3B is a later model than the plain S3; I believe it adds the second CW filter position and there are some circuit improvements. The '3C is identical to the B but has the second crystal deck.

The "round emblem" S-lines are later than the "winged-emblem" ones, and are priced a bit higher. The round emblem 75S3B/C (and a very few of the last winged emblem ones) has an additional rf transformer and a shield around the mechanical filters; these two features do improve the receiver performance somewhat. The late model rigs with "MCN" number stamped on the back are the most valuable of all; not any better, but the MCN numbers were used only on the later production runs, so seeing the number means it's a late-model set.

When I had S-Line equipment, I swapped around for a while and ended up with a winged 32S3, round 75S3B, and a 75S1 as a second receiver. It was a great setup.

I guess I missed the part where we decided that North America was the Universe.
Regardless of what part of the planet the shuttle is over, it will not be taking
calls from J. Random Ham. Neither is there a moral or leagal obligation for
them to work hams when they are in range of North America. As Patty Winter
points out, there is no reason they can't; they're just not scheduled for it.
All the voice contacts we know about will be by sked, and that is not
brain-dead, it's just their choice.

|>

|>before hammering at the TNC.

Gee, really? You mean I can only connect to the robot when it's operating? Thanks for the tip. Since, as you point out, they won't be doing voice over North America, it probably won't be a problem. Also, and you couldn't know this, since I don't leave my packet gear bleating over the air without my being in attendance and knowing that there's a chance of making a connection, again there should be no problem. But thanks for your concern.

I do not like the idea of ham radio becoming an 'Olympic sport'; what would be the criteria for receiving the Gold medal? Rudest contest operating procedure? Widest splatter? Worst audio quality?
Presumably you would test for use of illegal amplifiers in the same way as competitors are tested for performance-enhancing drugs....
If it does have to come, then i would suggest that the regulation should reward cunning, ingenuity and skill rather than brute-force. An electronic equivalent of orienteering is what i would like to see. Any such competition must, at all costs, avoid the situation that prevails in Formula 1 motor-sport, where anyone who comes out with an innovative technique (active suspension, ground-effect) everyone else appeals against it and it gets outlawed. This is a farce!
Maybe a ban on using commercially-built radios; what about a competition based on 'Heres a dead TV set; who can convert it to a transmitter and transmit 1000 words error-free in the shortest time....)
Oooer, i have just realised.... the result would probably be a **CW** transmitter!!!!; no good as a spectator sport, the masses would not understand..... no use for the advertising concessions!!!!

Source record: 8005

Dave;
You might have missed my earlier posting, but you and anyone else
looking for a 10M HT can find the last of the AEA DX-Handy stock at
Surplus Sales of Nebraska for $159 (originally $318 when I bought my
first one). It's a fine rig, whose only drawback is that it's VXO'd,
with provisions for only 2 crystals. Stock unit covers 28.250-28.300
on xtal "A" and 28.300-28.350 on "B". Surplus Sales tells me that they're
out of most of the popular xtals, but JAN can supply xtals for the
unit at much less than the original AEA price of $15 each.
Again, it's a really fun rig with a super reciever, good noise blanker
and a whopping 2W out. Runs off either 6 AA cells, 7 AA nicads (not supplied)
or external regulated 9.5v. Nicads can be charged in the unit, too. SSB and
CW. Working from my back yard near Detroit, my first contact was San Diego.

> sked-only operation? Who came up with this brain-dead idea?

I see that Patty has supplied answers, so I'll just expand on the
last question: I did. Not alone, but in concert with the SAREX Working
Group, with the strong support of Ron Parise and the other ham astronauts
and that of the NASA Public Affairs people (who are largely responsible
for SAREX being aboard the Shuttle at all).

The point behind SAREX is: 1) to promote amateur radio to the public,
and 2) to promote the manned space program. (You can guess which of
these is ARRL's and AMSAT's interest and which NASA's!) We (the Working
Group) came to the conclusion that the best way of doing that was to ensure
school participation in the program. Contacts by individual amateurs
from their basements are a secondary function inasmuch as they do
considerably less to promote A.R. and the space program. Aside from
the desire to get the "biggest bang for the buck," so to speak, we had
some concern as to how much support we would continue to get from NASA
if the project addressed only the (limited in numbers) ham community.
But the ham community hasn't been ignored; if you want a SAREX QSL, you
can get one by making a packet connection. It shouldn't be too hard.

There is nothing wrong with "regular" QSOs on an as-time-permits basis.
But on STS-35 there will be very little time available when the Shuttle
is over the U.S. STS-37 should be better in this regard, and we have
prospects for even better setups on later flights. (For example, one
future flight has _four_ currently licensed hams scheduled to be aboard,
with another crew member possibly working on getting licensed. The
Johnson Space Center ARC has done a superb job getting the crew members

interested and licensed.) So I suspect that you'll have more and better opportunities in the future.

But the primary mission, ASTRO, is scheduled for those periods. It's an astronomy mission that prefers to see the night sky, so nighttimes are pretty well taken up with ASTRO. (Ron, WA4SIR, is a payload specialist, meaning his main job is operating the ASTRO payload. SAREX is very much secondary.) The reason AMSAT has coordinated worldwide relay to the schools is because Ron's SAREX time is mostly when he's on the other side of the world!

It's always a good idea to listen before you transmit, but in fact a 600 kHz offset is being used between the SAREX transmit and receive frequencies. (Don't forget to set the "-600" mode on your rig...) Other terrestrial users would definitely appreciate our not transmitting when the shuttle is not in view or not in packet mode, however.

It may be that recent bulletins haven't stressed this point, but I'm sure earlier ones (like last spring) gave the schedule. Maybe a repost is needed. Also I think the information in QST made it clear that there would be few opportunities for non-school voice/SSTV contacts. Again, that was published last spring (actually, I think it was February), so it may not have been remembered. I think you're right--the multiple delayed launch attempts have gummed up the works.

> to read it.

No, you weren't asked. The ARRL is not a pure democracy but a representative democracy. That means you vote for the candidate for Director who most appeals to your Amateur Radio goals. What's that you say? There was only one candidate for Director in your division? Hmmm...makes you wonder how committed the complainers really are, doesn't it? It's not that hard to become a candidate: just get a petition signed by ten (!) ARRL members of your division.

It's by no accident that the form of representation of ARRL is somewhat like that of the U.S. Government (among other semi-respected organizations). It's the most workable system yet discovered. But like government, it depends on the participation of the people. All too few ARRL members participate. (Of course, nonmembers can't paticipate at all. Oddly, some of them take great pride in their nonparticipation.)

Oh, by the way, ARRL HQ has fewer staff now than it did a few years ago. Times are tight, and staff cuts save money. ('Course, services are reduced, too.) I don't recall hearing you complain about not being consulted when the cuts were made...

1708. Code Test Gimmicks

Newsgroup: rec.ham-radio
Date: 1990-10-05 14:27:38 UTC
From: DEFRANCO@TOPS20.RADC.AF.MIL
Message-ID: <12627372285.13.DEFRANCO@TOPS20.RADC.AF.MIL>
Source record: 8003

A couple of people have reacted less than maturely over the issue of code tests and whether copying dits and dahs, then translating is an allowable test method. Two points:

1. There is nothing in the testing rules I can find that prohibits this method. In fact, the elmer that helped me through the Novice code suggested that 5 WPM speed is slow enough to do it.

2. Regardless of a VE's motives, if he/she imposes a more strict requirement on code testing, and fails someone because he/she doesn't like their methods, he/she has exceeded their authority, and will likely do far more to damage the reputation of ham radio in the eyes of the non-ham community than they achieve by acting as VE's.

I think the idea of suing is ridiculous. We have enough frivolity in our civil courts now without adding this. As one person suggested, find another VE, or find someone in the examination chain to complain to. There is nothing to be gained for ham radio from having VE's, either old farts (or young farts) who are intent on "maintaining the purity of the code requirement."

>>I am highly musical in many different instruments and voice, and I'm STILL
>>trying to reach 13WMP.......

>>I just can't do it!

You could try my method if you want, it worked.

Use a computer. Get (or write) a program which will generate random code groups at a specified speed. Warm up with a speed you can do easily (even if it is only 4 or 5 wpm). If you can copy with only 1 or 2 errors in say 100 characters, increase the speed by 1 wpm. You will get to a speed where you are consistantly making more errors, and work there for a while until you can increase. If you get totally flattened by a speed, just go back one. Continue this until you break your pencil in half (at least 30 min.) repeat at least twice a day. You will break through the 10-11 wpm barrier using this technique.

I managed to get my speed reliably up to about 18 and then got lucky on my test. But I could never do it now.

In article <9695@uhccux.uhcc.Hawaii.Edu> johns@uhunix2.uhcc.Hawaii.Edu (John P. Shalamskas) writes:
>To the person who could hit 14 repeaters, yet couldn't access the patch:
>
>SHAME on you for not finding out what repeaters have 911, and how to access
>it!

1) CALM DOWN! We don't need another flame-fest.

2) Most repeater groups in Western Pennsylvania make their lists of emergency access codes available only to dues-paying members. Based upon my travels, this seems to be true elsewhere.

3) What is needed is a nationwide standard repeater code for accessing emergency services. Repeaters adhearing to this standard would be highlighted in the Repeater Directory. Any visitors to an area needing assistance would simply look up the nearest repeater with the standard code and call for help.

> phone, what is going to make them think this has anything at all to do
> with Amateur Radio??

Bill--

I worded that carefully. I said the schools' "transmissions" will be relayed via phone line to the ground stations in other countries. The schools *will* be transmitting on 2 meters (or whatever repeater band they wish). The repeater they're using will be autopatched to the Telebridge, but anyone listening to the repeater will hear both sides of the conversation *on amateur radio*.

One school wanted to have the kids speak into a telephone connected to the Telebridge because they didn't have a repeater with autopatch nearby. The League said, "No way."

I agree that it's a bit of a compromise, but only one part of the linkup is via phone lines. It was either that, or only work schools in the lower part of the U.S. This system seems acceptable to me under the circumstances.

Perhaps someone from AMSAT (which is handling the linking system) would like to say more about this.

>
> --Lauren--

Yes... just use the 'func-set' button, and then choose the desired step size that you would like, in the amateur bands you have the choice of 5, 10, 12.5, 15, and 25 KHz (maybe even 50KHz, I am doing this from my memory, and may be slightly off)... Note that you may have to use the up/down arrows (or is it the vfo knob, again with the memory problems) to choose the step size parameter. I think (again) that the tuning step size is shown with the mnemonics 'TS' in the display... consult your manual (it is in there).

The radio is realy versatile (sp?), you can change almost anything (when operating in the amateur bands, for some reason during 'out of band receiving' the step size does not allow as great a selection (I have noticed this in the 220 MHz and 8xx MHz range).

Hope this helps,

Rich (NM1D)

>grade and high schools since when I was a kid (not that long ago), no school
>will be in session in North America, and most of those kids will be fast
>asleep.

Ron will be asleep then, too.

The school QSOs are *not* scheduled for times when the shuttle is
passing near the United States. They are scheduled for times when
Ron is not busy doing what he's being paid to do: help run the
Astro 1 experiment. We are just damned lucky that he's on the "daytime"
team and not the other one. (Or perhaps NASA, which has been very
supportive of SAREX, put him on the day shift intentionally.)

Once they figured out when Ron could squeeze in some QSO time, then
the problem became, "Okay, how do we make it possible for Ron to talk
to kids in the U.S. at those times?" The solution was using ground
ham stations in South America and Australia to relay.

(Don't get confused by the fact that they're in the southern hemisphere;
if they were too far south, they couldn't hear the shuttle any better
than people too far north could. It just worked out that during his
free time, he'll be going over those areas.)

>Why wasn't that schedule ever posted here? All of the AMSAT bulletins I've
>seen make no reference to slotting; in fact, the only references were to
>operation from private stations. If there are some reserved slots, it would
>be the proverbial Good Thing to publicise them.

Someone did post a detailed SAREX schedule here a couple of months ago.
The two-way QSOs were listed as "DEMOS", which was explained at the time.

>>On the other hand, there's always the packet robot for those of us without a
>>sked.
>
>Such packets might be music to your ears and mine, but not to the schoolkids
>you'll be QRMing, as the robot and Ron are operating on the same frequency
>(albeit not the same time). Check out the MET schedule, and then listen
>before hammering at the TNC.

Paul, if you mean that people will be trying to access the robot during the times reserved for two-way skeds, I guess that could happen. But remember that the schools will not be transmitting on any of the shuttle ham frequencies. They'll be using whatever freq. their local repeater is on. Ron's half of the conversation will be coming out through the repeater as well. And of course, all this will be rebroadcast on WA3NAN and other NASA ham stations so that the rest of us can listen in.

>What we have here is....failure....to communicate. With all of the STS35
>launch attempts, some of the details have obviously slipped through the
>cracks. It would be a Good Thing if, in the interim, somebody were to
>take all the existing bulletins, integrate, filter, and amplify them.

Great idea, Paul. Thanks for volunteering! :-)

I am trying to find the latest (since the change late last year) Novice question pool somewhere that can be downloaded.

ARRL only sells a $18 diskette and Rich Bono's AUTOEXAM (excellent program) has only the old version of the questions. Tried a couple of ham BBS' (N8EMR, et al.), but the old questions were there as well.

Anyone know of a source?

It seems to me that it would do a great deal of good.

If I were a car thief *and* was driving a car that I had just stolen *and*
had a scanner/counter/fsm *and* the scanner suddenly indicated a strong
signal then I'd know that every cop in town would start looking for the
car that I would be in. I'd park it, wipe off any fingerprints and take
a bus out of the area pronto.

Apparently my opinion was misunderstood by others, including Patrick.
What I was trying to say is that all aspects of ham radio are well and
good, but let's not forget what the hobby/service is all about. Just
for the record, I, too, chase DX, work contests, etc. I'm in no way,
shape or form trying to say that any of these things is detrimental to
the hobby, but rather that there are some fundamentals deeply rooted in
the hobby that shouldn't be forgotten by those of us that do participate
in radio sports.

1724. FEMA Grants for Packet Gear

Newsgroup: rec.ham-radio
Date: 1990-10-05 20:20:00 UTC
From: lwrclmr@SACEMNET.AF.MIL
Message-ID: <9010052154.AA12796@ucsd.edu>
Source record: 7834

Sorry to post this to the net, but once again, I can't seem to get there from here.

This is in response to a request I had some time back for information regarding a FEMA grant our county got to purchase packet radio equipment. We received a matching grant for a $6K package to buy two systems consisting of a laptop PC, two meter radio, TNC, ruggedized carrying case for it all, and associated parts and pieces.

----Transcript of message follows----
Date: 22 Aug 90 07:31:00 CDT
From: "LWRCLMR" <lwrclmr@sacemnet.af.mil>
Subject: FEMA Grant
To: "choke" <choke@milton.u.washington.edu>
cc: "scxc3" <scxc3@tincan.sawyer.af.mil>

Carl,
I only have sketchy information at this time. You would be best to write to our Emergency Services Director for the information on what he submitted. Write to:

Marquette County Sheriff Dept
W. Baraga St
Marquette, MI 49855

ATTN: Lt Mike Zorza, Emergency Services

Phone: (906) 228-6980

Mike is a pretty good guy and has spent many years in the Emergency Services business and is also very good at getting grants. I'm sure if you write or call him, he can fill you in on the details.

Hope this helps.

Good luck in getting your ham ticket.

73,
Michael

+BTW, what's stopping car thiefs who are aware of Lo-Jack from buying
+a $200 frequency counter from checking for 900 MHz signals? Seems
+simple enough to me.

Except that Lo-Jak is only activated *after* the crime of auto theft is accomplished! :-) Even then, it would be dificult, if not impossible for the thief to deactivate the unit. They do not use the car's electrical system for their input power (actually it does, but just to keep the 13v nicads peaked!) nor is there any visible antenna that might be ripped loose to prevent the transmissions from happening. Not a bad system, but a bit pricey here in L.A. at $300-1200 installed.

MONDAY OCTOBER 8, 1990

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States.
It is published every week and is made available for unlimited distribution.

* MIR NEWS *
============
A new and exciting amateur radio project is being planned for the Mir space station known as the "Amateur Radio Experiment on Mir" or AREM. This project is the result of a collaboration between hams in the Soviet Union and the Austrian Amateur Radio Society (OeVSV). This project is designed to provide equipment for both 2M packet data and voice transmissions from Mir. The voice messages from Mir will provide timely information to radio amateurs while being another educational tool to help school teachers start students thinking about space science. The voice messages will be spoken in German, Russian, and English. The voice beacons will alternate with packet transmissions.

The basic AREM station will consist of a 2M tranceiver, a lap-top computer, a TNC-2 running at 1200 baud and using AX.25 protocol, and a voice sythesizer. A special external 2M antenna will be attached to the outside of the Mir space station for this project. The first AREM operations are expected to begin around January 1991 when an Austrian cosmonaut will install the station after he joins the crew of the Mir. After the Austrian cosmonaut finishes his mission on Mir, the equipment will remain aboard the space station. It is envisioned that an upgrade to this station will be to incorporate Bulletin Board System (BBS) software on the lap-top computer. This upgrade is not envisioned to happen until November '91. Also, it must be emphasized that if the cosmonauts wish, at any time they can pick up the microphone and call CQ. To obtain further information about AREM, please write to:

Wolf Hoeller (OE7FTJ)
Amraserstrasse 19
A-6020 Innsbruck
Austria

[Information via ANS and OE3ACC]

* BADR-1 NEWS *
==========
The University of Surrey would like to receive reports from anyone who is receiving BADR-1 on either 145.825 or 144.010 MHz. Brief reception reports should be sent to:

University of Surrey
UoSAT Spacecraft Research Unit
Department of Electronic Engineering
Guildford, Surrey GU2 5XH
England

* OSCAR-10 NEWS *
==========
Until further notice please DO NOT use AO-10's transponder!

* OSCAR-11 NEWS *
==========
Suggestions on the most useful operating schedule for UoSAT-2 should be sent to UoSAT as soon as possible so that they can be taken into account during an operations review due to take place later this month.

* OSCAR-13 NEWS *
==========
The present transponder schedule for AO-13 is as follows:

Mode-B : MA 003 to MA 165
Mode-JL : MA 165 to MA 195
Mode-B : MA 195 to MA 240
Off : MA 240 to MA 003 (Mode B Beacon On)
Omni Antennas : MA 240 to MA 060

The September 10 attitude estimate is:

BLON = 205 and BLAT = -7

* FO-20 NEWS *
==========
FO-20 is continuing to experience high temperature problems (due to the spacecraft experiencing no eclipse periods during which it can cool down) which is forcing a drastic reduction of operations. As of the weekend of 29 Sept 90, the battery temperature had risen to near 45 degrees C. Extended exposure to high battery temperature will decrease the useful life of the battery.

From To Mode
011090 0900 021090 0910 PSK Telemetry acquisition
041090 0955 041090 2330 JA
081090 0920 081090 1110 JA and JD
111090 0825 121090 0850 JD

The above dates and time are in UTC and the schedule may change without notice. The FO-20 Command Team will be monitoring satellite performance and operations during these times and may turn off the transponder if they

determine that the satellite is in danger.

This is a different situation indeed. Speaking as an
experienced police dispatcher, I would say that the department would
wonder why the ham insisted on using his/her own radio for something
that urgent. Calling for an "officer down" or "officer in trouble" is
probably the most urgent call you could make to a police department
(by their standards). Certainly it would justify ANYONE'S use of the
patrol car radio.
On the other hand, it is quite silly (yes, I've heard it done)
to autopatch an accident report with emergency units already at the
scene.

^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^^

I hate to be a pedant about this, but have had to "discuss" this with inspectors in the past. RG-8 Coax, regular yellow jacket Ethernet cable and regular phone wire are all flammable. They are also OK inside walls, under carpets, across closets, through roofs, down conduit and suspended in false ceilings.

If the cable is going to travel inside any air duct, it needs to be plenum rated. This includes any false ceiling used as an "air return". An air return is when the air returning to the egg-nishning unit goes via the false ceiling cavity rather than via special ducting. Now if a building is being "remodeled" or suffering "tennant improvements", all new cable in plenums must be plenum rated. If there is tons of old 25 pair telco cable abandoned in the plenum that is not plenum rated, it is grandfathered and no one complains. But that 25 foot run of phone wire you just slipped in better be plenum rated.

Plenum wire is more expensive than regular and harder to work with. The plenum rated Ethernet is teflon. See an earlier posting of mine in this thread for specs of Belden plenum Ethernet.

Thank you for your attention. We now return you to our regular programme: Code Wars

Are you asked personally when your home state seeks to raise its income tax from 5% to 5.75%? Of course not! You have elected representatives in the state legislature to do that for you. The same goes for the ARRL. They have division directors and section managers. If you don't approve of something they're doing, contact your local representative.

CB handles are probably not a good idea, but it's better than making the
dispatcher say "will the person at the accident scene please come back on
the radio, we have another question".

Isn't it about time to reduce the net bandwidth taken by this subject. The
FCC has closed its comment periods, so now let's drop the subject for a while.
I can't see how continued bickering here about the cw requirement
serves either camp on the issue.
At least until the FCC comes out with the "wrong" decision (whichever side
you're on).

Are you outraged at ME because demonstrating the use of hand signals is
still required on the drivers exam? Are you outraged at ME if you go to
engineering school, and are required to take some liberal arts courses?

Phil:

> "I hate Morse Code" <==> "Let's get rid of the code requirement"
>

Fairly recently, I was in favor of some kind of Morse-free ham exam. But now I am not so sure. I'm not so sure that the code test is too tough anymore, and I wonder if we really need to eliminate the only demonstration of operating skill on the exam.

I keep running into folks (in person, not on rec.ham-radio) who have some kind of interest in ham radio, but say they can't learn the code. After further questioning, my suspicion is that they have never really spent any time and effort on it. There are a lot of folks who have a 2 minute attention span. I have a feeling that if we eliminate one part of the exam, there will still be folks complaining about the other part.

The tests have slowly become easier and easier in the years since I passed my Novice as a 12 year old in the mid-1960s. I believe that there will always be pressure to make the tests easier. When do we stop?

> Tad, please let us know what you do believe in; what your opinions are.
> Opinions themselves are not subject to debate, because they represent what
> you are, and that is simply fact about you. What could be subject to
> debate are the facts you might use in support of your opinion.

I believe that it was too bad when a new licensee wrote a nice simple posting on here saying that he had studied the code, passed the exam, and found the experience enjoyable, and then someone describes their TOTAL OUTRAGE, as if by passing the exam he was engaging in some kind of evil conspiracy to drag us back into the 1950s.

This is a shame. Most of the repeaters here in Atlanta use * up # down
for the emergency patch and other proprietory codes for the general
patch. One problem is that there are greater than 20 jurisdictions in
our coverage area that use enchanced 911. You will, of course, be routed
to the jurisdiction WHERE THE REPEATER is located not where you are. There
are intertie methods used by the 911 operators, but this is causing more
and more problems. Our club's two machines are unique in allowing OTHER
three digit codes to access direct lines into the emergency centers of
the other jurisdictions as well as 911 to Fulton County.

I am not a personal fan of autopatches in general and find that most of
the emergency patches I monitor about traffic accidents result in a
redundant report since a cell phone user has already reported the incident
in a form the dispatcher is more familiar with handling. I do support
the club patch, however, for those rare times when the emergency patch
has been first to report an accident. I don't use the general patch
for a several reasons. I find very few times when it is necessary to
make a call that would be legal. I find that most non-hams have difficulty
dealing with a half duplex call. And I prefer privacy for my personal
calls.

We have several club members who use the patch very very frequently. Some
of their calls seem of dubious legality and most seem very frivolous.
Our club rules say that patches have priority so we have to patiently
stand by and let the patchers play. More times than not the content of
the patch is "Honey I just left the office". An office that I'm sure
had plenty of telephones available. Phew! At least the pseudo business
users are getting music on hold more and more lately. Even they realize
they can't get away with listening to music on the amateur bands.

Sorry about drifting off the subject, but I just listened to three of
these nimrods making dumb patches.

Professional car thieves would have the car on a transporter out of state
or in a chop shop inside an hour. The amateurs are usually just joyriders
anyway and will abandon the car when it's time for them to go home to
mommy. LoJack may help you find the abandoned car, but if a Pro got it,
you'll be buying it's parts back at the corner auto parts house tommorrow.

1742. SOLAR TERRESTRIAL FORECAST AND REVIEW

Newsgroup: rec.ham-radio
Date: 1990-10-07 01:41:56 UTC
From: std_oler@HG.ULeth.CA
Message-ID: <901006194156.24001269@HG.ULeth.CA>
Source record: 7848

The response I received from the previous Solar Terrestrial Forecast and Review posting was large enough that I have decided to make the reports a regular weekly feature. In addition to the weekly reports, I will post special flare reports for all major flare occurrences as well as special geomagnetic storm alerts and descriptions/forecasts of these events. However, these special reports will only follow major noteworthy events and will not be a regular part of the Solar Terrestrial Forecast and Review.

Comments and/or suggestions are welcome.

-------------------------------- Cut Here ----------------------------------

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---
October 06 to October 16, 1990

Report Based In-Part from Data Obtained from the
Space Environment Services Center
Boulder Colorado

BRIEF SOLAR TERRESTRIAL REVIEW AND SHORT-TERM FORECAST

Solar activity between 29 September and 06 October was Low. No major active centers were visible on the solar surface this week, although several moderately large spot groups did traverse the disk. In particular, Region 6294 (located at S05W57 on 05 October) is the largest visible spot group on the disk, covering an area of 1,440 million square kilometers (900 million square miles) encompassing a total of 26 sunspots. Although this spot group is moderate in size (class DKO system), it is a relatively simple and non-threatening bipolar group. Region 6294 is the next biggest active region (located at S16E48 on 05 October). This region covers an area of 1,290 million square kilometers (806 million square miles) but only encompasses a total of 7 individual sunspots. The largest spot is, however, a visibly large k-type sunspot. Region 6294 is a relatively simple bipolar group. Region 6297 (located at N20E09 on 05 October) is a relatively compact bipolar system consisting of 24 small spots (largest spot a type a-spot) within a region boundary of 330 million square kilometers (206 million square miles).

Flare output this week was low. The largest flares were C-class x-ray events and subflares. Several bright surges occurred this week, two of which occurred on 05 October. The first bright surge occurred near N25W90 at 06:07 UT and was attributed to Region 6303 which has now crossed the western limb.

Region 6283 also produced a bright surge near S10W90 at 12:37 UT while crossing the western limb.

Solar activity is expected to remain low until at least 10 October when a few moderately active regions are due to return. Predicted 10.7 cm solar flux values for 07 to 08 October are 170 and 175 respectively. There is only a 20% chance of an isolated M-class flare throughout the next three days. There is no chance of an X-class or a Proton flare from any of the simple active regions currently on the solar disk.

The most recent sunspot number (for 05 October) was 181 accompanied with a 10.7 cm solar flux of 169. The solar x-ray background intensity on 05 October was at a class B8.6 level. A brief radio burst of 245 s.f.u. occurred between 01:41 and 01:42 UT on 05 October at a frequency of 245 MHz.

Coronal hole effects are believed responsible for the recent increase in geomagnetic and auroral activity. Periods of Active to Minor Storm levels have been observed at high latitudes accompanied with visual auroral activity. The increased geomagnetic activity is expected to remain at mostly Unsettled levels for the next several days. Activity is expected to increase to mostly Unsettled to Active levels between 08 October and 13 October due to coronal effects afterwhich it should again subside to Unsettled levels. No geomagnetic storms are currently anticipated from this activity, although localized minor storming may be possible at high latitude and nothern middle latitude locations. Global geomagnetic activity is expected to keep the planetary magnetic A-index at or near 15 for the next two days (ending 08 October).

Radio propagation over middle and high latitude paths has been disrupted due to auroral activity. Moderate rapid fading in middle to high latitude path signals is anticipated for the next several days until geomagnetic and auroral activity subsides. Geomagnetic and auroral-based signal aberrations will be worst between approximately 10 pm and 5 am local time for middle and high latitude paths. Low latitude and southerly middle latitude paths should escape many of these effects, retaining mostly good to very good propagation throughout the period.

SUMMARY OF ALL ACTIVE REGIONS VISIBLE ON THE SOLAR DISK AS OF 06 OCTOBER

Region #	Location	LO	Area	Class	LL	Spots	Magnetic Type
6292	S16W27	286	0030	AXX	02	003	SINGLE POLARITY
6294	S05W57	316	1440	DKO	10	026	BIPOLAR
6296	N33E04	255	0030	BXO	03	002	BIPOLAR
6297	N20E09	250	0330	DAO	10	024	BIPOLAR
6300	N12E32	227	0420	DAO	09	016	BIPOLAR
6302	S16E48	211	1290	DKO	07	007	BIPOLAR
6304	S15E06	253	0180	DAO	04	007	BIPOLAR
6305	N17E27	232	0060	BXO	02	005	BIPOLAR
6306	S23E65	194	0000	AXX	00	001	SINGLE POLARITY

NOTES:
"Location" is the location of the center of the active region as

measured from the central meridian of the solar disk. "LO" represents the actual heliographic longitude of the active region. "Area" is the area of the active region given in million square kilometers. "Class" represents the Modified Zurich (McIntosh) Sunspot Group classification (consult a good text on sunspots for a description of these classes). "LL" represents the angular extent of the active region (in heliographic degree's). "Spots" gives the number of sunspots which were visible within the active region at the time of observation (this value is dependent upon the location of the active region on the solar disk). "Magnetic Type" specifies the type or class of magnetic behavior within the active region. Potentially potent active regions almost always have complex magnetic field configurations. Therefore, the potency of a specific active region can usually be estimated by observing the magnetic type of the active region. Single and bipolar regions are usually too simple to produce significant solar activity.

ACTIVE REGIONS DUE TO RETURN BETWEEN 06 OCTOBER AND 08 OCTOBER

Region Latitude Longitude (Helio.)

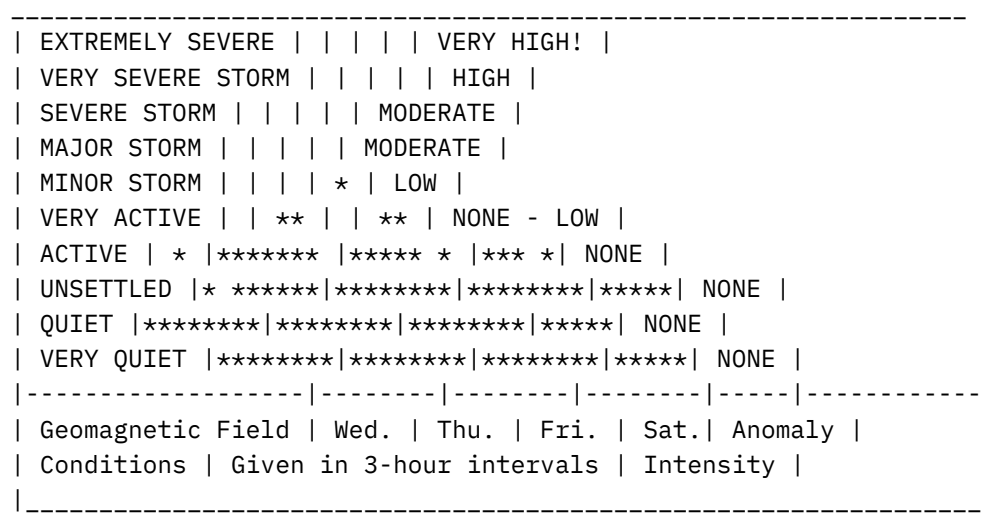
6266 S27 145
6267 S12 145

GRAPHICAL ANALYSIS OF RECENT GEOMAGNETIC ACTIVITY - BOULDER COLORADO

Cumulative Geomagnetic Activity History
Peak Geomagnetic Activity during the past 87 hours



NOTES:
This graph ONLY depicts geomagnetic conditions observed at Boulder, Colorado for the past 87 hours. Conditions to the north of Boulder will generally have slightly higher activity than Boulder, while conditions to the south of Boulder will likely have lower activity than those depicted here. However, the plots should present a good approximate average of planetary geomagnetic conditions.
"Anomaly Intensity" is meant to represent nothing more than a very rough guide to the --potential-- interaction geomagnetic fluctuations --might-- have

on earth-based systems sensitive to magnetic fluctuations (ie. electrical power distribution networks, telecommunications networks, etc.).
For radio signal propagation purposes, plot lines are approximately proportional to propagation quality when plot lines are below Minor Storm conditions. Propagation quality may deteriorate rapidly (ie. non-proportionally) when plot lines reach or exceed Minor Storm levels. Complete radio blackout conditions on all short-wave frequencies may occur if plot lines reach or exceed Severe Storm levels.

PLANETARY 10-DAY GEOMAGNETIC ACTIVITY OUTLOOK (07 OCTOBER - 16 OCTOBER)

|_____________________________________________________________________|
```

NOTES:
Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

Cumulative 60 day Solar Activity Record
Start Date: August 8, 1990

NOTES:
Left-hand column digits represent the 10.7 cm solar radio flux obtained from Ottawa. The right-hand column describes the relative solar activity for that period based on the average number of major and minor flares that can be expected for related solar flux values. Plot lines labeled with the letter "F" represent days where at least one major flare occurred (ie. class M5 or greater flare).

NOTES:
Latitudinal boundaries are the same as those given above for radio propagation quality. Periods of high auroral activity may be suitable for auroral-propagation. Locally visible moderate auroral activity will almost always cause moderate to strong deterioration in HF signals, while locally visible high auroral activity will render most HF bands useless.

Auroral activity is defined as follows:

NOT VISIBLE: Not visible

LOW: Diffuse, inactive auroral activity visible very near the northern horizon for mid and low latitudes.

MODERATE: Visibly active, but not exceptionally bright auroral activity most visible above the northern horizon for mid to high latitudes. This type of activity usually encompasses torch-like (or beam-like) aurorae mixed with low-intensity curtain aurorae.

HIGH: Visibly very active, with periods of bright, pulsating curtain aurorae possibly mixed with moderate intensity zenith aurorae. Can occur to the north as well as stretching up near the zenith, particularly at middle latitudes. There may be some color fluctuations discernable.

VERY HIGH: Very active, very bright and very colorful auroral activity possibly mixed with intense zenith and curtain aurorae. Visibly strong pulsations with auroral boundaries to the zenith, stretching even partway to the southern hemisphere of the sky.

EXTREMELY HIGH: Rare, incredibly bright auroral activity with rapid color and brightness fluctuations mixed with very strong rapid auroral pulsations visible throughout the entire sky.

There are three plotted lines per day in the auroral activity prediction charts. Each of these three plotted lines represent three periods during the evening/morning when auroral activity can be seen. The first line represents the evening twilight period. The middle line represents the --local-- midnight sector, while the last line of each day represents the morning twilight period.

The auroral activity predictions charts are heavily based on recurrent phenomena and may not be accurate in the longer-term due to unforseen and unpredictable transient events (ie. such as solar flares).

The visibility of auroral activity depends on your location and the brightness of the sky (which is dependent upon both city lights and lunar phase). These charts do not account for these variations. The charts are based on dark-sky conditions (lunar phase excluded). Aurorae occur independent of sky brightness, so just because auroral activity may not be directly visible (due to lunar phase, for example) does not mean auroral activity isn't in

progress.

In article <05.Oct.90.12:11:22.BST.#3652@UK.AC.NWL.IA> PJML@ibma.nerc-wallingford.ac.uk ("Pete Lucas, NCS-TLC, Holbrook House, Swindon") writes:
]It continues to amaze me how the makers of HT's fail to provide them with
]adequate front-end selectivity; i was recently looking to buy a simple (Cheap!)
]2-meter HT, and *NONE* of the various ones i trialled in the dealers seemed
]immune to 'squawks'. It generally seemed that 'the more features, the worse
]the RF performance'. One, which shall remain nameless, suffered terminal
]intermodulation on a 1/4 wave whip.....
]
]What *is* the point on providing sub-microvolt sensitivity if the thing
]dies laughing at anything over a millivolt? Maybe if the designers of these
]radios were forced to use them in a real environment (one with more than
]one transmitter!) they would change their mind.
]Get the designers out of their shielded RF test-environments and into a
]big city full of nasty, intrusive RF.

There are several things required for a good front end. The ones hard
to get in a small, low power package are:
(1) selectivity. Q takes space. Low Q parts require more of them, taking
space. For synthesized radios, which require a broad band front end,
you need sharp skirts on a wide bandpass. That takes lots of poles/
zeroes, which takes parts, which takes space. Get the picture?
(2) linearity. Most front end problems are not caused by selectivity,
they are caused by intermodulation or blocking (desense). Both of
these are crucially affected by the amount of power consumed by the
RF amplifier. You wan't low intermod, and little desense, you run
a lot of power - like 100 mW to 1 Watt. This leads to lots of screams
and hollering from hams who want low power drain receivers on their
HT's, and don't realize that this leads to lousy front ends.

Of course, you could use a good balanced mixer, with no RF front end,
but then you lose the sensitivity.

What WOULD be nice would be a receiver attenuator switch, which would
toss in about 20dB in front of the receiver.

Don't be too hard on the designers of these radios. I doubt you could
come close to the wonders that they create, given the constraints
placed on their engineering.

Howdy!
Saw the interest for University ARC's so I thought I put two or
three cents in. The Texas A&M ARC (W5AC) is another one of those
oldest clubs on campus. Actually we have been around since 1912.
We operate all HF bands, 6m, 2m 70cm and a few members even fool around
with 10.328 Ghz. We are also active on AO-13 and packet--I think we
have 4 nodes here at TAMU--you would have to check with our packetmaster
AA5AV. If you hear us on, give us a shout. Generally someone is operating
around lunchtime (12 - 1:45 CDT) on weekdays. Anyone wishing to sched
can give me a yell via network mail or on the air.

Incidently W5AC will be operating a special events station on November 29, 1990
CQ Bonfire will be active on all bands depending on the number of people
in the shack that can work the station during the day. This special events
station will be commemorating the 80th burning of the Texas A&M Aggie Bonfire
which is held each year before the game against Texas (t.u.). All stations
are invited to work W5AC. More details later.....

If I were a "pro" car thief, I would have a large, 18 wheel truck that
I could drive the car into after ripping it off.
This 18 wheeler would be heavily shielded. Sort of a large, mobile
Faraday cage :-).

1748. MOD FOUND: widens 2sat xmit coverage

Newsgroup: rec.ham-radio
Date: 1990-10-07 08:37:47 UTC
From: dt@yenta.alb.nm.us
Message-ID: <1894@yenta.alb.nm.us>
Source record: 7855

I have just discovered a way to turn off the policeman in the 2sat that stops the transmitter from operating outside of 140-150 mc. The only limitation is now transmit VCO lock range, which, out of the box, is about 137 to 162 mc. I'm sure by tuning a slug one could raise or lower this coverage "window".

To do the mod, you'll need a soldering iron with a VERY fine tip, some fine solder, some small screwdrivers, a 1N914 diode (or other small silicon diode), some fine (wire wrap) wire, and (probably) a magnifying glass!

Follow the directions on page 34 of the instruction booklet to take the unit apart. This allows the front panel to be removed from the radio. No further disassembly is required, or recommended. Watch out for the little springy-dingy that locks the battery in place on the radio (the book so cautions).

Looking at the inside of the front panel, you should easily spot the CPU chip. (it is even shown as a square symbol in the picture on page 34.) Just to the right of the bottom right portion of the CPU is a teeny three legged device, exactly to the right of which are three solder terminals where another such device could fit. Here's some ascii art:

```
||||||||||||||||||||
|--------------------|
=| |= vacant diode chip pads
=| |= |
=| |= |
=| C P U |= /
=| |= ---XX--- XX
=| |= | |
=| |= -XX--XX- XX XX <=== point A
=| |=
|--------------------| / ---XX--- <=== point K
|||||||||||||||||||| | | |
| -XX--XX-
|
diode chips-----/
```

The scaling is pretty bad, but it's pretty easy to find the three unused pads, then look left for one diode chip, then down and to the right for the other, as shown.

To implement the mod, it is necessary to install a diode of your own from point A (anode) to point K (cathode) in the diagram above. These points are EXTREMELY close together, and the board is delicate, so I recommend the following:

Take a 1N914 diode and cut the leads to 1/8 inch or less, then solder fine (26 ga. or thinner) wires of different colors to the leads, noting which is the cathode and which is the anode. Now put a piece of heat shrink or tape over the diode so that only the little wires escape. This assembly can now be safely soldered into the circuit, and the unit carefully reassembled.

Reset the CPU (inside font cover of manual) and you're on the air!

1749. can 2sat do repeater split of 6.46 MHz?

Newsgroup: rec.ham-radio
Date: 1990-10-07 08:43:47 UTC
From: dt@yenta.alb.nm.us
Message-ID: <1895@yenta.alb.nm.us>
Source record: 7856

I was trying to use a (non-amateur) repeater which has an offset of 6.46 MHz, and I couldn't get the 2sat to do it. It seems that, regardless of the selected "tuning speed" (from the SET mode), when choosing the repeater offset, you can only dial it in 25 KHz increments. Thus, 6.45 is a possible offset, as is 6.475, but 6.46 defied my most desparate and undignified efforts!

What gives? Is this the first computerized, synthesized ICOM radio that is less flexible than its predecessors with respect to this feature? Of am I the first ICOM owner who both needed the feature and is too dense to figure it out?

little david

>This is a real shame! I can understand if clubs want to keep their
>autopatches private, but there should be a known code for emergency
>access. Here in AZ, the Arizona Repeater Association has 3 open-to-all
>auto-patches.

There are some real practical problems with this in the large metro areas(I'm going to use San Jose as a reference cuz that's where I'm most familiar...) In this of area we have ~14 different local police agencies, about the same number of fire agencies, the California Dept of Forrestry, California Highway Patrol, etc. If you dial 911, it will reach the dispatch center for the city the phone number is located in. This is of no help if your in a different city (a real easy thing to be in the bay area at least...) and the 911 dispatchers aren't equipped to re-route the call.

What the main emergency-oriented machines locally have is a couple digit number for each of the respective agencies. You bring up the patch, then enter the appropriate code. I believe the code numbers on the two machines are identical(someone care to correct me on this...I'm thinking of ASH and ADZ) The fly in the ointment is that each of these machines keeps the phone patch numbers private...you've got to be a member to know the codes.

Is this a bad thing...depends on the implementation. In my area I've NEVER heard a station who didn't have the codes not get through IMMEDIATELY. The members of these repeaters fall all over each other racing to the keypad to bring up the autopatch. The club policy is that ANYONE can place a call....they'll do the dialing for you if necessary (i.e. when you aren't a member....) Now this system probably breaks down in the wee hours of the morning when no-one else is around, but when a club decides to offer these services it is there right to determine how they're used....

Summary is the system we have locally works pretty well for our area.

]ahead of time. What do you use 2 meters for? Haven't you talked
]on any repeaters at all? Most clubs publish these codes in their
]newsletters. Are you in any clubs?
]

OK. Everyone who doesn't know how to access the autopatch on every repeater in the world turn your license back in to the FCC. It is our RESPONSIBILITY to have this information at our finger tips no matter wehre we happen to be driving.

What drivel.

Where were the control operators for all these repeaters?? FCC regs state that automatic operation requires a control operator. I couldn't find one on 14 machines.

As I said in the last message, the next time, I will just flag down someone with a celular phone and not even waste time with ham radio.

Correct. ;-)

> You were asked about this some time within the last 2 years....it's
> called electing a board of directors to run the afairs of the league
> on your behalf. Seriously, should every single item that the BOD
> deals with be put up for a general election? Seems to me that

I don't call an election of officers carte blanche to spend dues money
hiring new staff. Any item that the BOD decides that involves adding salaries
or otherwise committing large sums of cash should indeed be proposed to the
membership first.
This is especially galling when the League has to ask for special
contributions to fund its preparations for WARC '92. I think such preparations
are among the most valuable services the League can perform, but asking me for
extra money in almost the same breath as telling me they've decided to hire 3
new people without consulting with me is a bit much.
I don't mean to be arrogant-sounding about this. The "me" or "I" in the
above paragraph should be taken to mean "me, the average ARRL member."

> Please, if you have a suggestion on how to change this to a method that
> would be efficient let me know....I'm one of those elected officials.

Pleased to meet you. While I'm not in your section, I will answer your
request because I think something should be done.
How about posting an article in QST whenever the League wants to hire new
paid staff or make major purchases for HQ? A reasonable
comment (or voting) period should be allowed - say 4 to 6 months to
allow for the Postal "Service" to deliver the QSTs (I never get mine
before the second week of the cover date month) and get the replies
back.
Replies or votes could be solicited at the members' expense (I
would spend 15 cents to send a postcard) to either HQ or, perhaps more
reasonably, to the SMs.

> basis. I'd be glad to tell them of your ideas. For that matter

1754. Re: Novice test code requirement... Aga

Newsgroup: rec.ham-radio
Date: 1990-10-07 18:27:37 UTC
From: mdella@polyslo.CalPoly.EDU
Message-ID: <270f7399.5d4e@petunia.CalPoly.EDU>
Source record: 7862

Having recently ordered a commercial band UHF radio (Icom IC-U16) for use in public safety (medical/sheriff rescue), I'm wondering what the FCC's latest is on the "Communicator" class license. I plugged through my Tune In the World book and think I can handle Novice and Tech theory/regs, but I'm enrolled in paramedic school right now, and don't want to spend the time dealing with morse code. I'm not looking for comments on whether or not YOU think a no-code license is a good idea, I'm looking for info regarding if this is going to happen or not, and if yes, when? I realize the FCC's proposal was for 220MHz and above, which is fine for now for me (the U16 will work in the 440MHz amateur bands).

What's the scoop?

-Kirk J. Smith, EMT-1A (EMT-P Intern)

Maybe ICOM found a way to keep you from unlawfully using your
non-type-accepted amateur equipment to transmit outside the ham bands.

Ignore if you're not the person mentioned above.

Get in touch with me. Been trying to reply, but the mailpath keeps bouncing.

Still interested in the radio.

When you get in touch, send me your address, mailpath, and phone #. That way we can keep in touch.

RTTY DX Notes 1of3 10/5/90

RTTY DX Notes for week ending 5th October 1990
BID: $RTDX0510
Part 1 of 3.

Who said the bands were dead? If you look at the reports, and there
were over 300 stations reported this week, you will see that 21 and 28
MHz seem to have obtained the most attention from the people in the
contest, while after the contest everyone migrated back to 14 MHz.
Maybe we should look at the higher bands more often.

Our thanks this week go to I5FLN, JA1BLV, OD5NG, TG9VT, VE3XJ, VK2EG,
W2JGR, W9CD and the Tri-State DX Packet Cluster Network. Thank you
all for your assistance and abundance of information. Please keep it
up.

Part 3 of 3.

QSL Information:

ZS9J is Leo Heinonen, 80 Sixth Street, Parrhorst, 2193 South Africa.

J39BS collects his cards via WB2LCH.

BY4AA says to QSL via DJ6BU.

4K0ADS is railway mobile and is travelling all over the country. QSL via RW3AH.

BZ4DAB, Tang, says to QSL to Box 085-205, Shanghai, China.

4U1ITU was operated by F6GMB, to whom the cards should be sent.
TG9VT says to QSL only via W3HNK.

Notes of Interest:

ZK3KY is now active from Niue Island and will be there for a month. She will operate around 0900Z on 21 and 14 MHz RTTY.

St. Pauls Island. FP5DX and VE1KM will operate from October 20 using the calls of CY9SPI and CY9DX and will operate RTTY. QSL via FP5DX.

Angola, D2. There is still much activity at official levels for the issuing of permits and licenses for an operation in this area. They are trying to get RTTY included in the permitted modes.

Malpelo Island operation is still on track for 2nd November.

South Sandwich and South Georgia are still scheduled for late November/early December with the special calls of VP8SSI and VP8SGI respectively.

GL DE DX1.

I am trying to repair a vt100 that I got for the right price.
Upon inspection the monitor board had a blown(literally) electrolytic
capacitor(C439) and a toasted diode (CR408). I replaced the capacitor
but I am having difficulty Identifying the diode. The number on the
diode is RC2C-010GI (I think that is what it says, the G could be a
backward D but then the RC2C part would not be the right way.)
Does anyone know what this diode is and/or a replacement number for it.

Thanks

I would think that some RF monitoring could be of tremendous help to
a thief trying to protect himself from LoJack. Since it isn't activated
until after the car is stolen, a fleeing theif could find out the instant
that the LoJack unit in the car was activated.

This would be a good time to ditch the car.

> to the jurisdiction WHERE THE REPEATER is located not where you are.

One local repeater has handled this problem very nicely. Here in the
Chicago area, the authorities have set up a service where any cell-phone
user can dial *999 and be connected to a central dispatcher who will determine
where you are and contact the appropriate local jurisdiction depending on
what needs to be done. The repeater trustees have configured the repeater
so that the same *999 code will autopatch to the same dispatcher.

I haven't had a reason to use it yet, but it seems like a useful service,
and something that other repeaters may want to emulate.

> Are you outraged at ME because demonstrating the use of hand signals is
> still required on the drivers exam? Are you outraged at ME if you go to
> engineering school, and are required to take some liberal arts courses?

Of course not.

First of all, you might need to use such hand signals if your signal lights fail, and you might need to interpret these hand signals if you encounter someone on the road whose signal lights have failed.

Now I know someone is going to immediately be willing to say something about "what if your microphone fails" or "what if the other guy can only send CW". Let me put these potential arguments to an early rest.

UNLIKE the open highways where you do NOT have a choice in who you have to deal with, on the radio you can choose who you QSO with, and what modes you even want to use. You do NOT need to be prepared to communicate with EVERY ham there is.

In an emergency situation, there is usually going to be SOMEONE on some frequency that some transmitter can transmit on. It isn't necessary for EVERY ham to be able to communicate in every mode and every frequency for emergency purposes. CW might be used in an emergency, but there will be enough hams around who can copy it as witnessed by the large number who tell us how much they love CW and Morse Code.

Tad, when you speak of engineering school, are you talking about one of those 4 year extended trade tech schools, or a 4 year University?

The latter does require liberal arts courses, as that is their tradition. The former does not. However, the latter is not telling the former that they have to. If you are considering an education in engineering, and if you don't want to even take any liberal arts courses, then I am sure you can find some program that will let you do it your way.

Ham radio does not yet give you a choice. There are 5 license classes and not ONE can be earned without having to bow down to demands of the Morse Code traditionalists and learn something the candidate may or may not be interested in.

If you graduate from an engineering school without having taken any liberal arts courses, you may not be able to get a job. The reason is that the skills and understanding of human nature, life, and society, as taught in these courses, is essential for even engineering work in every engineering field. You need to understand the thinking of people who use what you design. You need to be able to communicate with the people you work with. If you can get that ability some other way than liberal arts courses, then

that is fine. If I were hiring for engineers, and one came along who did not have any liberal arts courses, he would not be hired by me unless he could show that he had the necessary capabilities learned through other means (and "life learning" is ok, too).

The point is, although liberal arts skills are really needed in engineering careers, you are not forced by law to take such courses just to get an education, because you can choose to educate yourself any way you want.

There is no way to get use of the radio spectrum for hobby and experimental purposes without bowing down to someone else perception of what is needed that cannot be proven to (any more) actually be needed.

I am not outraged at you, Tad. I am just disappointed you could not come up with a better analogy to the situation with ham radio.

> Fairly recently, I was in favor of some kind of Morse-free ham exam. But
> now I am not so sure. I'm not so sure that the code test is too tough
> anymore, and I wonder if we really need to eliminate the only demonstration
> of operating skill on the exam.

I'm interested in what changed your mind. Do you think that the code test was easier than you once thought? Let me put this to rest. The code test is BLATANTLY EASY. I learned 5 WPM to get my Novice exam in just 6 hours of study. If I were to place a value on my ham license based on the study and effort I put into (which I do NOT ever do) then I would have to consider it to be WORTHLESS. But don't worry; I base the value of my ham ticket on the benefits it can bring me, not on how much effort I put into getting it. I look FORWARD to assess values, instead of backwards.

Another point I would like to bring is whether or not we really need to even have candidates demonstrate so much operating skill. Not all hams are going to be doing the kinds of things where personal operating skills, such as CW, or any of the other techniques that are people-based. Some could well be interested in experimenting with technical things only. Others might be more operating oriented than the techies, but be only interested in local VHF/UHF communcations, where their speaking skills will work better.

If we need operating skill tests, why not have ones that test what most hams really do most. If we cannot decide and agree on what that is, then let each of us choose and be limited to using what we choose to test on.

> I keep running into folks (in person, not on rec.ham-radio) who have some
> kind of interest in ham radio, but say they can't learn the code. After
> further questioning, my suspicion is that they have never really spent
> any time and effort on it. There are a lot of folks who have a 2 minute
> attention span. I have a feeling that if we eliminate one part of the
> exam, there will still be folks complaining about the other part.

There always will be people like that. A few of those people might not have correctly identified why they don't like Morse Code. A few more might not be properly motivated because they expect ham radio to be something

that they have to actually USE Morse Code on. A few more still might not actually be able to learn Morse Code. And finally, there are some who are NOW, and even under FCC proposals to fix this proplem, STILL WILL be excluded from ham radio because they cannot copy code by ear at all (and some of them can do so by watching a blinking light).

> The tests have slowly become easier and easier in the years since I
> passed my Novice as a 12 year old in the mid-1960s. I believe that
> there will always be pressure to make the tests easier. When do we
> stop?

Part of the pressure to make things easier is because the code test is present. And the tests are also easy because the process of selecting the questions to test on is not as advanced as it should be. Further, even many of the WRITTEN exam questions are no more applicable to what most all hams need to know than the code test is.

Proposals have been suggested on this newsgroup and elsewhere on how to go about fixing the written exams.

1. Each question will apply to the BASICS of radio operation, radio theory, rules and regulations, and safety, that is applicable to the general use and cooperation of sharing a spectrum resource.

2. Technical questions shall be generated by computer using a published algorithm freely available to the public. This algorithm shall, for each question, generate 1 from a wide diversity of possibilities. For technical questions that include numeric calculation, the range of numbers chosen shall be very wide. No question shall have fewer than one hundred forms possible. Same may have more than a billion.

3. Questions on FCC Rules shall be written to assume that a copy of the actual current rules is on hand for the test taker during the test. Publishers will surely jump on the opportunity to publish a copy of the rules as a separate booklet. It will be the responsibility of the candidate to bring the rules booklet, and the VE will verify that it contains no other material or notes.

Once the rules are cleaned up and made applicable, a step not likely to take place until after the code issue is resolved in favor of having at least one codeless class, then the pressure to ease the tests will only come from those not really qualified to share the spectrum.

But remember, we are to be testing on the competency to use and share the radio spectrum, not on how much someone can "be like us".

> > Tad, please let us know what you do believe in; what your opinions are.

I don't concur fully with the outrage. Though I don't have the original posting on the screen at the moment, I do recall an inference in it that everyone should have to take the same test, because it was easy for one person. When I originally read that, it was weak enough at the time to not be worthy of a rebuttal. It is the subsequent spark of debate that my rebuttal is addressed to.

> What's the scoop?

We won't know for sure until the FCC acts on the matter. "Stay tuned".

Some of use, on BOTH sides of the issue, believe it will happen. We just
differ in the belief of WHY it will happen. In fact I have never heard
anyone say they are confident it won't happen, but I have heard a few
people say they are confident it will.

What particularly concerns me is HOW it will happen (if it does).
I happen to believe that the FCC's proposal AS IS will severely damage
ham radio, and of course the "no code" movement will get blamed.
The ARRL proposal, which I feel does not do enough, is certainly
far better than what the FCC proposed.

Those are good examples of the extremes. I would not hesitate to use the police radio (assuming it is functional and accessible) to call in the "office down" report. Regardless of my location in the United States. In a foreign country, there would be hestation, as the laws in those country are "foreign" to me, and I don't know what severe trouble I might be getting into. I'll suggest that readers outside the US post what they might think could happen in their countries in these kinds of situations. I would be interested, too, in cases where the native language us not English and the passerby is in such panic, they cannot recall any of their Berlitz tapes to use anything but, say, English.

Still some people might be intimidated by the police radio, or afraid that they would not be believed, or whatever else. If they have another means of communication that are already familiar with anyway, they might still prefer using that. Quite likely it would be faster for the average person to use 911 on his cellular phone than to use the officer's radio, anyway. Panic will set in for many people, and using the police radio might require them to think more about how to do it, than to just do what they already know how to do.

The latter example is certainly the absurd case, but I've known people to do such things, and would very well believe it to have happened.

I guess I could be just as absurd back to that person and ask them why they didn't just go tell the police officer (or other emergency personnel) who where right there, in person.

K6LFH SILENT KEY

HR AMSAT NEWS SERVICE BULLETIN 279.01 FROM AMSAT HQ
SILVER SPRING, MD OCTOBER 6, 1990
TO ALL RADIO AMATEURS BT

The Amateur Radio Satellite Program lost one of its early pioneers and strongest supporters when Chuck Towns (K6LFH) passed away on September 28th at his home in Los Gatos, California. A memorial service was held on October 5th in Saratoga, California.

Chuck was one of the founding members of Project OSCAR and was very active with the first several amateur satellite projects in the 1960s. He continued to promote the amateur satellite program until his passing. Many amateurs in the San Francisco Bay Area became active on amateur satellites because of the support and help Chuck provided.

[ANS would like to thank WB6GFJ for the information in this bulletin.]

SILVER SPRING, MD OCTOBER 6, 1990
TO ALL RADIO AMATEURS BT

New AMSAT-NA Board of Directors Elected

AMSAT-NA Headquarters has announced the results of the recent Board of Directors election. The following candidates were elected and will serve for a two year period in accordance with the Bylaws:

1) Tom Clark (W3IWI)
2) Doug Loughmiller (KO5I)
3) John Champa (K8OCL)

Elected to serve as First and Second Alternates to the Board are candidates Junior De Castro (PY2BJO) and Joe Kasser (W3/G3ZCZ), respectively. Alternates will step in to fill any seats on the Board which occur as a result of a resignation before the next Board is seated in the fall of 1991. AMSAT-NA would like to thank all those members who took the time to cast their ballots. The new Directors will serve beginning with the annual AMSAT-NA Board Meeting which starts on Oct. 19, 1990 in Houston, TX and will be present throughout the AMSAT Space Symposium, available to discuss issues with the attendees.

6Y5/WD3Q AO-13 DXpedition Planned For Oct. 9-13

Long-time AMSAT-NA volunteer and OSCAR enthusiast Eric Rosenberg (WD3Q) is currently planning to operate AO-13 from Kingston, Jamaica from Oct. 9-13, 1990. All are especially invited to join Eric on AO-13 on Oct. 10, 1990 at 00:00 UTC as he plans to demonstrate OSCAR communication techniques to local hams in the Kingston area. Eric will be staying at the QTH of Hugh Brand (6Y5HB) while in Jamaica and will use either Hugh's callsign, 6Y5HB, or his own call, 6Y5/WD3Q. Those who wish to QSL can send their card directly to: WD3Q, 338 14th St., NE, Washington, D.C., 20002.

FO-20 UPDATE/SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 279.04 FROM AMSAT HQ
SILVER SPRING, MD OCTOBER 6, 1990
TO ALL RADIO AMATEURS BT

Latest Japanese Bird Still Experiencing Temperature Problems

The FO-20 Command Team at JARL report that FO-20 is continuing to experience high temperature problems which is forcing a drastic reduction of operations on the bird. Unfortunately, because FO-20 is currently experiencing a period of eclipse-free orbits, the natural cooling off of the satellite during eclipse is not occurring. Therefore, the reduction of transponder operation availability is one way to reduce the internal temperature build up. As of the weekend of 29 Sept 90, the battery temperature had risen to near 45 degrees C. Extended exposure to high battery temperature will decrease the useful life of the battery.

Although it is subject to change at any moment, this list is the current schedule of operation for FO-20:

From To Mode
+-
08 Oct 90 0920 08 Oct 90 1110 JA and JD
11 Oct 90 0825 12 Oct 90 0850 JD

The above dates and time are in UTC.

The FO-20 Command Team will be monitoring satellite performance and operations during these times and may turn off the transponder if they determine that the satellite is in danger.

[ANS thanks the FO-20 Command Team and WD0HHU for the information in this bulletin]

OPERATIONS NET SCHEDULE

HR AMSAT NEWS SERVICE BULLETIN 279.05 FROM AMSAT HQ
SILVER SPRING, MD OCTOBER 6, 1990
TO ALL RADIO AMATEURS BT

AMSAT-NA Operations Net Schedule Announced

AMSAT Operations Nets are planned for the following times. Mode B nets are conducted on an AO-13 downlink frequency of 145.950. Mode J/L nets are conducted on an AO-13 downlink frequency of 435.970.

Date Phs mode UTC NCS Alt. U.S. day

9 Oct 90 172 J/L 0015 WD0E WB9ANQ Monday

- 15 October 90 reorientation to 180/0 -

21 Oct 90 98 J/L 1800 WB6LLO W5RRR* Sunday
27 Oct 90 135 B 1300 WB9ANQ KA5SMA Saturday
03 Nov 90 98 J/L 1500 N5BF WD0E Saturday

* Most NCS operators will be at the AMSAT Symposium at JSC in Houston, TX on 21 October 90. As a result, this net may be cancelled.

Nets are scheduled for North American geographic coverage and time zones, although other parts of the world are often within the footprint and checkins from everywhere are welcome. Those who don't have adequate and convenient coverage from this net are encouraged to schedule their own nets via AO-13. Write to AMSAT Headquarters with your schedule and we will run it in ANS.

For information on the amateur satellite program and how you can participate, contact AMSAT-NA Headquarters at P.O. Box 27, Washington, DC 20044, phone (301) 589-6062, or contact your local AMSAT Area Coordinator.

SB ALL @ AMSAT $ANS-279.06
AO13/AO10 TRANSPONDER SKED

HR AMSAT NEWS SERVICE BULLETIN 279.06 FROM AMSAT HQ
SILVER SPRING, MD OCTOBER 6, 1990
TO ALL RADIO AMATEURS BT

A new Transponder Schedule for AO-13 was put into effect on September 8 which is planned to continue through October 17.

Mode S operation has been eliminated for the time being since relatively poor solar panel illumination does not allow sufficient power for proper battery maintenance during Mode S and S/B periods. Satellite reorientation (a.k.a. magnetorquing) is scheduled to commence on October 15 and once it has been completed, it is expected that Mode S will be returned to service.

The present transponder schedule for AO-13 is as follows:

Mode-B : MA 003 to MA 165
Mode-JL : MA 165 to MA 195
Mode-B : MA 195 to MA 240
Off : MA 240 to MA 003 (Mode B Beacon On)
Omni Antennas : MA 240 to MA 060

The September 10 attitude estimate is:

BLON = 205 and BLAT = -7

AMSAT-OSCAR-10 appears NOT TO have been receiving sufficient solar panel ill-
umination to support Mode-B transponder operations. Both beacon and trans-
ponder signals show signs of FMing. Until further notice please DO NOT use
AO-10's transponder.

It is expected that AO-10 may once again receive sufficient solar illum-
ination to support Mode-B transponder operation by sometime in November.

AMSAT SYMPOSIUM, PART 1

HR AMSAT NEWS SERVICE BULLETIN 279.07 FROM AMSAT HQ
SILVER SPRING, MD OCTOBER 6, 1990
TO ALL RADIO AMATEURS BT

The Date for the AMSAT Symposium is Drawing Near

There is not much time left to make your plane and hotel reservations for
this year's AMSAT Symposium which will be held during the weekend of October
19, 20, and 21 at the Johnson Space Center (JSC) Visitors Center.

Presentations will be held in the Visitor's Center Auditorium, and have been
scheduled for all three days of the weekend. The talks have been scheduled
in serial alignment so that you will not have to choose between two talks at
any given time.

Friday's talks, which begin at 3:00 PM include: Satellite Image Processing
for the Amateur, AMSAT-NA Education Activities and finishing with AMSAT
Orbital Data Management. Saturday's activities begin at 8:00 AM. A scan of
the program lists talks on such topics as:

The Decoding Telemetry from the Amateur Satellites
In-Orbit Performance of 4 Microsat Spacecraft
A discussion of AO-13's Orbit
A report on the Phase 3D Project
Phase 4 Technology as it Applies to Phase 3D
Macromets and Microsats
A Pacsat Demonstration
Microsat Motion, Stabilization, and Telemetry
Full Motion Digital Video Via Amateur Satellites
SAREX Hardware for STS-35 and 37
Astronaut Deployable Satellites
Webersat Operations and Experiment Results
AMSAT-NA Operations Organization

The Development of 2 DSP Modems

Regular tours of the Johnson Space Flight Center will be available throughout the weekend.
/EX
SB ALL @ AMSAT $ANS-279.08
AMSAT SYMPOSIUM, PART 2

HR AMSAT NEWS SERVICE BULLETIN 265.08 FROM AMSAT HQ
SILVER SPRING, MD OCTOBER 6, 1990
TO ALL RADIO AMATEURS BT

Saturday evening's activities will be held at the JSC Employee's Recreation Center with the ever-popular Attitude Adjustment Hour followed by a Texas Bar-B-Que Dinner. AMSAT is very fortunate to have as its Guest Speaker Mr. Aaron Cohen, Director, Johnson Space Center. Following Mr. Cohen's address the AMSAT-NA Annual Meeting will be held.

Sunday's activities begin at 9:00 AM and the topics to be presented will be: Getting Started in Amateur Satellites, Building a Versatile Homebrew Satellite Ground Station and Poor Boy Satellite Station. For those who can delay their departure time until late Sunday, there will be a chance to attend an open house (starting at 1:00 p.m.) at the world's largest amateur antenna, W5UN, the station that brought DO-17 (Dove) back to life.

When making airline reservations, please note that Hobby Airport is MUCH closer to JSC than Houston Intercontinental Airport. Contact AMSAT Headquarters at 301-589-6062 for further information on Symposium registration and accommodations.

> and more problems. Our club's two machines are unique in allowing OTHER
> three digit codes to access direct lines into the emergency centers of
> the other jurisdictions as well as 911 to Fulton County.

Either the emergency system there is NOT properly setup, or else you have
not arranged to have the repeater's phone line automatically route the
call to a central dispatcher.

You should at least make sure that the dispatching computer knows the number
of the repeater, and brings up instructions to the dispatcher for all calls
coming on in that number to explain that it is coming in over a wide area,
and that it is operating via radio. That avoids having to explain all this
to the dispatching during the call.

> I am not a personal fan of autopatches in general and find that most of
> the emergency patches I monitor about traffic accidents result in a
> redundant report since a cell phone user has already reported the incident

> for a several reasons. I find very few times when it is necessary to
> make a call that would be legal. I find that most non-hams have difficulty
> dealing with a half duplex call. And I prefer privacy for my personal
> calls.

This is one reason I am trying to find a way to put up (not as part of a
repeater) a FULL DUPLEX patch. Among the difficulties in this:
1. Manufacturers of patch equipment don't know how to deal with full
duplex very well. They think it cannot be handled by other than
direct access to the discriminator of the receiver to detect the
presence of carrier, even though a fast attack, long hang, VOX, on
an ordinarily squelched radio will do the job with no modifications.
2. Full duplex requires split band operation, which not all hams yet are
prepared to do, though many more are starting to get the equipment.

> We have several club members who use the patch very very frequently. Some
> of their calls seem of dubious legality and most seem very frivolous.
> Our club rules say that patches have priority so we have to patiently
> stand by and let the patchers play. More times than not the content of
> the patch is "Honey I just left the office". An office that I'm sure

> had plenty of telephones available. Phew! At least the pseudo business
> users are getting music on hold more and more lately. Even they realize
> they can't get away with listening to music on the amateur bands.

I might suggest bringing up a rules change, or finding a new club. The priorities should be based on WHAT the communications purpose is, not on what means were used to do it, as long as both equally require repeater access. Sure, communications that could be done simplex SHOULD be done simplex. Two stations running brick amps and yagis can talk simplex across even the largest towns unless they are quite hilly. There are many other situations simplex works fine. Always check the repeater INPUT frequency, and if you are receiving the other station, suggest a QSY to a simplex frequency (NOT 52.525, 146.52, 223.50, or 446.000)

> Sorry about drifting off the subject, but I just listened to three of
> these nimrods making dumb patches.

And these guys learned code?

1770. Icom R1 battery charger

Newsgroup: rec.ham-radio
Date: 1990-10-08 01:48:14 UTC
From: charlie@oakhill.UUCP
Message-ID: <3951@radio.oakhill.UUCP>
Source record: 7870
Cross-posted to: rec.ham-radio,rec.radio.shortwave,sci.electronics

This is for Icom IC-R1 owners etc.....

I just received my R1 from my Japan mule. Boy is it small!
Anyway...the charger is for 100VAC. Since the power company
around here likes to sell more electricity (my line voltage
is 125VAC) has anyone had problems with using a 100VAC
charger on US mains? The thing gets kinda hot.

2nd question. Anybody got schematics for the little beastie?

What a cute little toy!

1771. IC24 offset

Newsgroup: rec.ham-radio
Date: 1990-10-08 03:38:53 UTC
From: lauren@vortex.COM
Message-ID: <56.UUL1.3#1@vortex.COM>
Source record: 7927

Perhaps I should have been more explicit. You can set whatever offset
you like, down to 5 Khz, for VFO setting. But my question was really
involving the reaching of repeaters running at odd T/R offsets
(e.g. other than 600 Khz in 2m). As far as I've been able to determine,
the IC24 won't let you set the T/R offset for repeater operation in other
than 25 Khz steps. For example, in the Los Angeles area, there are at
least 2 repeaters with offsets that aren't an even multiple of 25 Khz.

Does anyone know of a trick to get a non-25 Khz multiple offset into
the IC24 repeater offset setting? Thanks.

I have nothing to say about legality in this note; I am only
concerned with the effectiveness of 'calling the cops via radio'.

I have heard the public service radio traffic in SoCal courtesy
of a friend who moved there recently: they do seem to have
a much more common sense approach to communications than
us East Coasters do (I love it!--see Org: line).

Nevertheless, I doubt your transmissions would be taken seriously
by the dispatcher. If you appear to be in the same category as
someone who happened to pick up a stray police portable, they
would likely be more concerned with recovery of the radio
and finding out how you acquired it than much else, emergencies
possibly excepted. Convincing them of the genuine nature of
your call consumes time and reduces your effectiveness.
Net effect: no better off than calling on the phone.

Using the same language and procedure as the police do on the radio
would allow your message to blend in and be acted on as efficiently
as the rest of the traffic: I can personally vouch for that approach!

Yet, all these approches short-circuit the system. In the event
that there is a need for followup investigation of the incident,
there is no log tape of your call on the 911 phone system, so
if you get snafud along the way, you have little recourse.
Net effect: no better off than calling on the phone.

In the regulations concerning amateur radio license and radio traffic, it is quite clearly said, that in a serious emergency (where human lives or considerable amount of public or private property is on stake), anyone is REQUESTED to do ANYTHING to get help on the way. I teach this way on a novice course, too.

I presume this would include "modified" ham radio gear and police repeater frequency as well. Before they go digital (not likely in a few years' time) or use scrambling (not common here), I would also easily think of several situations where this would be the best way to call an ambulance, for example. Remember, sometimes seconds DO count. However, I believe that an emergency call on 2 meter repeater would be faster - it would almost certainly take A LOT of explaining to the police radio operator to convince them. But that would be ONE possibility. MUCH faster than to run and look for a phone - say, from an accident site on a highway. Not everyone has a cellular phone in their car yet.

A whole other thing is to misuse the equipment. As far as I know, there was a ham (should I call him that?) in this town who got caught of chatting with the cops with his IC-2GE. Apparently, he was seriously drunk (getting caught almost requires that, I think).

He was facing charges of "Serious disturbing of security traffic" (or whatever that REALLY is in English) and possession of illegal radio transmitting equipment.

The point here is, that the latter charges were dropped - or at least they tried to get them dropped - on the basis of the fact that radio amateurs are permitted to build their own equipment, if desired. Thus, the modified IC-2GE would be a mere subject of his construction project... Remember, ham gear don't have to be type approved, if it is not meant to be sold.

Well, what's the bottom line? I am sorry to say that I don't know. The details of his case are unknown to me. I heard this from a fellow ham who was asked by the poor guy's attorney (as far as I understood it)

to help with the case. I don't know how it all came out - or even if
it there has been a trial yet.

I thought it might be of general interest to many of you if I made the announcement of a new Conference - The Microwave and RF Forum. Accessable directly from RES-Q (tm) (201) 881-7421.

(Also available as Group Mail from 9:100/9 & 9:833/7 as MW_RF)

MW_RF is made available by Compact Software, Inc. soley for the purpose of furthering knowledge within the Microwave and RF community, [and my assurance of no commercialism].

CSI designs CAD/CAE software for all phases of design and development, so there are many engineers here who would enjoy the opportunity to participate in roundtables and such...

If you are interested in bringing a forum such as this to it's feet, ask your local SysOp to obtain the Microwave and RF Forum.

Bill Kreps, SysOp of RES-Q (tm)

> adapter--to provide a way to charge the internal batteries with the
> fast charger?

There seems to be a misunderstanding about the BA-12. It has NOTHING to do
with the fast charger. The BA-12 is a little voltage/current regulator which
slips ontop of an external battery pack (e.g. BA-90) to allow you to charge
it using the supplied wall charger (at normal charge rates).

1779. Request for Info -- AVM on 33 cm band

Newsgroup: rec.ham-radio
Date: 1990-10-08 13:55:30 UTC
From: jhk@SATURN.ACC.COM
Message-ID: <9010081355.AA12139@saturn.acc.com>
Source record: 7929

Subject: 902-928 Megahertz Band Automatic Vehicle Monitoring Systems (AVM)

This weekend there was a spirited discussion of new band plans for
the 33 cm amateur allocation, including a review of the recently
adopted Southern California Repeater and Remote Base Association
plan. A motion to adopt this plan for our area was tabled for, among
other things, a lack of information on what frequencies would be
used for the Automatic Vehicle Monitoring systems that have recently
been approved by the FCC for this band. Additionally, the amateur
allocation has a secondary status to the AVM, so we must stay away
from whatever frequencies are chosen for it.

In the SCRRBA plan, 903-912 and 918-927 megahertz were set aside for
AVM usage in southern California, resulting from a meeting between
members of that group and ITS/PACTEL in January 1990. The question
that arose at our coordinating committee meeting yesterday was if
the ITS/PACBEL usage of these frequencies is nationwide, or does it
apply only to southern California ? Secondly, what is the timetable
for these systems to be deployed in the Baltimore-Washington-Philadelphia
corridor ? Lastly, who is (are) the commercial licensee(s) for the
system in this area ? Also, we'd like to get some technical info
on how the system works so that a prudent band plan could be developed.

Any information that you could provide on the preceding questions
would be of great assistance. Please respond either directly or
to the mailing list. I'll summarize in a few days if the volume
warrants. Thanks very much. 73

>Why install scanning etc. on a radio when the squelch is kept open *ALL THE
>TIME* by garbage from the local paging TX?

Yeah, REALLY! There is a local pager that gets into my TH-215 *TERRIBLY*
making it unbearable to passively listen to one of the local repeaters.
I had problems with intermod from a digital paging system when I lived on
Long Island, too, right smack on a packet channel.

WHY are these things such a problem? It seems almost universal that they
throw all kinds of crap everywhere. Numerous letters have been fired off
by me, but none of these companies have ever responded. Are the FCC regs
too lax on this type of transmitter?

1781. LoJack

Newsgroup: rec.ham-radio
Date: 1990-10-08 14:08:27 UTC
From: MEDELMA@CMS.CC.WAYNE.EDU
Message-ID: <9010081414.AA12096@ucsd.edu>
Source record: 7930

I had a chat with the head of the local plainclothes squad about LoJack
the other day; a few interesting facts:

Most thieves will take the car, park it out of the way, punch the
trunk and grab what they can. The car will be abandoned well within
an hour of theft.

Those looking for parts will often park the car in an out-of-the-way
spot and come back for it later- like at night- before stripping it.
LoJack might get it first, in this case.

Basically, my friend said, LoJack is for the insurance companies, who'd
rather pay for a few locks on a car (minus your deductable, of course)
than for an entire car.

He also mentioned that my car, with 4 antennas, two radioand call sign plates
was more or less calling out "steal me! steal me!", but that's another matter,
I suppose....

1782. This whole Code Test Thing

Newsgroup: rec.ham-radio
Date: 1990-10-08 14:29:57 UTC
From: MEHARP01%ULKYVM@PUCC.PRINCETON.EDU
Message-ID: <9010081445.AA13551@ucsd.edu>
Source record: 7931

This latest thing about the code test absolutely amazes me. Now, not only do have to copy the code, but you have to do it THEIR WAY! This is ridiculous in the extreme. If I were ever refused a license for that, the poor guy who did it would wish he had never heard of me by the time I got through with him. I'd report him to every agency I could think of. This is way outside the parameters defined by the FCC. All they say do is COPY it, they don't say how. All Part 97 specifies is that you have to do it by ear. Not words, not letters, just hear it and interpret it. The method is up to you.

As for the poor misunderstood volunteer, I have no sympathy. He does NOT have the right to do that. All he is doing is practicing the same exclusionary elitism that is ruining this hobby. He (or she, whatever, you know what I mean) deserves any good public squashing that you can do. Report him to the VEC, the FCC (probably more productive, VEC's tend to have different attitudes, don't get me started on that), and the ARRL. Make sure you can prove that you did copy the test correctly. If the VEC doesn't override his decision, go to the FCC. Produce the same evidence. You should at least be entitled to a test before an FCC examiner. The FCC examiner will not care how you do it. I personally would not be satisfied until I had ensured that the VE in question never gave another exam in his life.

If this kind of crap is going happen, then bag the VE system and go back to the old way. I would even be willing to bet that if a lawsuit were ever filed based on this, the FCC would insist on that. I do feel very confident that the FCC would retest any applicant who was rejected because of this. They want to flush the code requirement anyway.

I'll entertain any and all flames. In fact, i'll enjoy it! Please do by all means.

> over each other racing to the keypad to bring up the autopatch.

When I was a new ham, I tried to call 911 to report a shooting. I tried every repeater I could hit & found noone that could place the call. Of course, it was about 2am. I agree that we should standardize 911 repeater autodials, even if multi-city boundaries may life tough on the 911 operators.

The other option is to suggest that all hams should carry cellular phones to make emergency calls. Really says something about our usefulness doesn't it?

I went to More Intercept Operator School (058) for the
Army more than 30 years ago. Code was only 4 hours a day.
The school was about 4 months long. In less than 2 months
I was at 15 WPM on the mill, 20 WPM with a pencil and 25
WPM with a ball point pen. The pen has lower friction so
I could write faster. I had typing the other 4 hours and
the best I could do as 13 WPM. I can do a little better
now using two fingers. I have 0 music ability and very
poor finger coordination, most anybody can learn code if they
try. No one failed the school due to lack of code speed.
I am sure that I could have gone much faster if I could
transcribe it. I heard 50 WPM tapes and they didn't sound
all that fast. I knew people who could transcribe 100 WPM
code while reading a book and smoking a cigar. I heard of
people who could transcribe 60 WPM Baudot code (RTTY)

In the WRTC last July, all contestents use a 100W transciever. They could cause splater and have bad audio, but I did not hear any. Both SSB and CW were used, I wish there was some RTTY also. The USSR has had radio sport competition for a number of years, and fox hunting I understand is quite popular in Europe. Lets not be a wet blanket and have a positive outlook on the radio sport competitions. I personally think it is a great idea and can be a lot of fun. And if we have the competitions and the average joe becomes interested in the "sport", who knows, we might even start to get some young people to become interested and want to join. Lets have a positive outlook and support the positive aspects. I am sure we can put resonable limits on the sport to prevent the use of large linears, rude habits, and other socialbily unacceptable behavoir.

I will agree with Mr. Bray that there is some misunderstanding abou the BA12, however the misunderstanding is on his part best I can tell :-)

The BA12 that I own will not fit atop any of the battery packs that I own. In fact, the BA12 is necessary to use as an adaptor so as to charge the internal batteries carried by my R1 when I use the fast charger. When I buzzed out my BA12 (which by the way is marked "battery adaptor"), I found it to be a simple passive circuit, ie straight through connections. There is no means provided to connect the R1's wall charger to the BA12 either. Furthermore, when my external battery pack is attached, the internal batteries cannot be charged via the fast charger.

Very funny. I can jam police radios, broadcast remotes, taxi services,
fire departments ... but I can't use an oddball offset conveniently, inside
or outside the ham bands. Bravo.

I suppose if I one of my alligator clips broke while I was soldering onto
it, you'd say that radio shack found a way to keep me from unlawfully
using it to smoke dope!

I hate to ruin your day, Stark, but ICOM purposefully designs radios so that
a simple mod will allow transmission outside the ham bands. There's money
in it, so they do it. My friends and I buy them because of it.

Hey, some people select a car that can do 135 mph over an otherwise similar
car that can only do 80. Go to rec.autos.driving and bother them for a while!

Rich Bono, if you are reading, THIS is the kinda guy I was talking about.

>

I must be the exception that makes the rule.. :-)

I can't carry a note in a covered basket and I can read CW, although...

I'm an ex-USN radioman and the way the Navy teaches it is to beat it into
your head for a couple of weeks (It seemed like 8 hours a day for the first
week).

And although I like copy CW, I also think that a change needs to be made.
If Amatuer Radio is going to continue, it is going to have to attract people
and "I" think that CW "can" be a stumbling block for a lot of people.
Just my 2 cents..

Jerry (ex-WB7RHQ and soon ??)

Go to your local Ham Radio store and get a charger for the IC-2S or
IC-24 series walkies. Better yet, get the fast charger. You will probably need
the bottom adaptor as an interface. Take the R1 with you and they will be able
to set you up.

The thing that clips onto battery packs and that you plug the wall trickle
charger into is called the AD-14. They're pretty scarce, I imagine because
demand for them is huge..

well, it seems to me, Civil Air Patrol repeaters frequently straddle the 2m band; they don't seem to mind "modifed ham gear" vs. type accepted, and to my knowledge this is not unlawful; no I am not an attorney, but quite a few CAP types here in Austin are also hams, and go this route, so I think we may not wish to assume dt there is looking for a means to an unlawful end.

cheers

>be getting into. I'll suggest that readers outside the US post what they
>might think could happen in their countries in these kinds of situations.

I come from Lima, Peru where officers are killed constantly.
Unfortunately the officers don't carry portable radios like here. However
when a officer is shot the police highly appreciate people calling in for
help from the squads radio if the policeman was not on foot patrol.
Unfortunately people panic and are afraid to go near police car
because of the risk they encounter doing it. (A police squad may come to
the scene and see a wounded officeer and a civilian *terrorist* in the car
and shoot him.) I would say that if you are willing to take this risk go
ahead, but remember that many countries have delicate situations and
anything ould happpen.

>throw all kinds of crap everywhere. Numerous letters have been fired off
>by me, but none of these companies have ever responded. Are the FCC regs
>too lax on this type of transmitter?

Chances are that the transmitter is well within FCC specs. It's not
unusual for a paging company in a metro. area to run 15 or 20 transmitters
all belching out 250 Watts in simulcast. If your DC-to-Light HT doesn't
like that, then there is probably no where to hide. Only once have I seen
the intermod generated in the transmitter instead of the receiver. That
was when the isolator load had blown open at a site co-located with
other transmitters. If you can back up your claim with proof you might
get the company to listen to you. Things will happen a lot faster if
you can get the FCC field office to make the call for you! I speak from
experience!

1801. Circuit to add odd offsets to IC24

Newsgroup: rec.ham-radio
Date: 1990-10-08 20:41:00 UTC
From: lauren@vortex.COM
Message-ID: <57.UUL1.3#1@vortex.COM>
Source record: 7963

On the assumption that no method exists to program odd repeater offsets into the 24, I took a look at the schematics to see if it would be practical to add such functionality. It appears that it might well be.

The simplest technique would seemingly be to program the transmit and receive frequencies of interest in two adjacent simplex memory channels. A circuit would then be needed to bump the channel up when PTT is pressed and back down when PTT is released. Since it takes a significant fraction of a second for carrier to come on when PTT is pushed, the channel switch should occur before transmission actually begins.

The rotary channel selector simply provides an up or down pulse to the logic each time the knob is turned. The circuit under discussion would provide this same pulse based on the PTT operation. Of course, a means to activate and deactivate this function (perhaps by an "invalid" combination of keyboard buttons pressed simultaneously) would also be needed.

One nice thing about this concept is that it would involve little or no work on the PC boards, but could be almost totally interfaced at the PTT and rotary switches. Building the circuit small enough to fit in the unit might be a challenge, but there actually is some room in the area of the UT-50 PL encoder/decoder card.

The real question is, has anyone attempted this before, or done anything like it? And of course, if it turns out there *is* some way to program the odd offset directly, this would all (happily) be an academic discussion.

>The point here is, that the latter charges were dropped - or at least
>they tried to get them dropped - on the basis of the fact that radio

We should be thankful that, with the exception of a few states, ownership of
equipment is not restricted. It's a question of *use*, not ownership, of
equipment that is regulated in the U.S.

>the modified IC-2GE would be a mere subject of his construction
>project... Remember, ham gear don't have to be type approved, if it is
>not meant to be sold.

In the U.S., Ham gear does not require type acceptance, whether it is to
be sold or not. This assumes, of course, that the equipment will *only*
be used in the amateur service. The flip side is that Ham gear cannot
legally be used on any service that requires type-accepted equipment (and
that includes, for example, Citizens Band) unless it has received type-
acceptance for that service.

So what this tells me is that in the U.S. (1) you won't be in trouble for
owning a radio that can be used in any particular service; (2) you *might*
get in trouble with a police department for any of a variety of technical
points if you tried to talk on their frequencies; and (3) you *probably would*
get in trouble with the FCC for operating equipment in a service for which
it was not type-accepted, if you used your ham gear to chat on police
frequencies.

I don't own an ICOM, though I've heard they're very good units. For what it's worth, I can say that the Kenwood TH-75A solved the problem by providing three "special" memory locations which can take oddball splits (out of a total of 10). You use them by 1) programming the memory normally, thus setting the receive frequency, then 2) dialling up the transmit frequency, pressing the memory button, pressing and holding the PTT switch (unit doesn't transmit in this case), and pressing the same memory channel number. This saves the transmit frequency.

It might be worth trying this out on the ICOM on the off-chance that it can store separate TX and RX freqencies in at least some of its memory locations, documented or not. (Hi, Lauren! Good luck.)

You must not read QST! :-)
The shortwave broadcast station he's talking about has call letters W1AW.
They recently had Harris equip it with commercial transmitters. I don't
disagreed with their decision to go with commercial grade transmitters,
by the way. As to it being a broadcast station, read the article in QST about
how the computers fire up the transmitters to BROADCAST their bulletins
without monitoring the frequency first. This is my only objection to their
operations. There has been debate here before as to the legallity of
automated QRM so I won't go into that. Many hams feel the service out
weighs the interference. I do too, even though I still think it sets a
bad example of poor operating practice.

J> It is easy to find out the 911 emergency codes for almost every repeater
J> in the state of Hawaii. ...everyone has nearly standardized on one of
J> the following: 911, *911, or *9.

A ham friend who represents a local club (Northern Colorado ARC) to the
CCARC (Colorado Congress (?) of ARCs) tells me the statewide convention
is:
911*

That works on three of the four patches of which I'm a member, but I
think the fourth one is "*911" (I might be wrong about that).

Re: "What do we lack? A distress frequency."

On which band? Unlike many radio services, there are many different ham
bands.

I'll assume you mean 2M. A problem I see is that many times the best
frequency to use is a repeater, especially from an HT. Unfortunately,
for some strange reason, repeaters are spread around all different
frequencies. :-)

Seriously, as a ham who travels with an HT, if I have an emergency I'd
rather try to hit a repeater than call on a simplex distress frequency.

What is ARRL doing about restrictive covenants? PRB-1 doesn't
have anything to do with those.

> WHAT!!?!? Is he hallucinating? When did the ARRL invest in a
> shortwave broadcast station?

Perhaps he means W1AW, which "broadcasts" legal one-way
transmissions that are supposed to be of interest to the amateur
community (plus code practice) on several amateur shortwave bands.
W1AW was just extensively (and expensively) renovated and operates
using top-line commercial-grade radio and computer equipment.
I do read QST. That's how I know all this.

I got my novice in 1957 as KN4RMT and upgraded to K4RMT 9 months later. In the early seventies I lived in Maryland and applied for a change of call: I got W3GRG - obviously the calls in 3-land went slower than in 4-land. Now, back in the South, my W3 is rather unique, but I would still kill to get K4RMT back - sure wish I had kept it (it was never reissued). Sigh.

Way back then, if you had been licensed for 25 years and had an Extra-class, you could apply for a 1x2 call. How did you get K6ZH at your tender age?

> Gosh--here I am at age 42 and I can join QCWA! A sobering

Likewise, the FCC agrees that the service is legal. In fact, I recall that the FCC has often affirmed that the ARRL is on solid ground by running their transmissions and has even opined that people who run "right of navigation exercises" by transmitting on top of the W1AW bullens/code practice are subject to being cited for bad operating practices. Their reasoning was that the ARRL is recognized internationally as the "national radio society" for the US and that the W1AW schedule is very well publicized.

BZZZT! Wrong answer. Commercially produced HF linear amps have to
be type accepted. The odd criterion for acceptance is that it can't
work on 10 meters, or be easily adapted for 10 meters. Too many
10 meter amps were ending up on 11 meters.

"Easily modified" seems like a fuzzy term. I think it refers to amps
whose instructions might read:

"Warning! To maintain type acceptance, do NOT remove the bright
orange tab on the bandswitch that prevents rotation to the 10/11
meter position!"

Hams can still build their own amps without type acceptance, but not
more than one per year. They are also free to modify the "not easily
modified" amp to run on 10 meters, but that may count towards their
annual quota.

>It is quite fun to build your own QRP CW rig. I built a "Tuna Tin 2"
>from the ARRL's "Weekend Projects" book and had a lot of fun with it.

I've looked at this project on and off for quite a while (since the original article was printed, in fact). However, this rig (and several other old projects from the mid- to late-70's) uses a Radio Shack choke that stopped being available almost as soon as the article appeared (either the 10 uH or 100 uH choke, I forget which one; one of these is still available (or was a few months ago). Since all of these articles give modifications in terms of number of turns (and not resulting inductances), the construction info works only for these specific parts.

Does anyone have information on the resulting inductances, or another source (name, part number) for the same parts?

1820. Re: 2M HT's and intermodulation.

Newsgroup: rec.ham-radio
Date: 1990-10-09 14:45:12 UTC
From: rdb@mtunf.ATT.COM
Message-ID: <1385@mtunf.ATT.COM>
Source record: 7971

The ham club at New Jersey Institute of Tech in Newark operates K2MFF/R on 147.225.

HT's monitoring this machine suffer from severe intermod. The signal from another local repeater mixes with the signal from a mobile phone (not cell phone - the old kind), creating a new signal on 147.225. The end result is that you can listen to both the other repeater and Newark Mobile Phone conversations at the same time. The intermod is strong enough to drown out K2MFF/R.

The intermod is caused by signals mixing INSIDE the HT's. Mobile/base tranceivers do not suffer from this problem.

A few days ago, my ICOM-751 developed a Memory-storage problem....
..it would store properly so long as you kept the same "mode", but
when trying to store a different mode (such as changing from usb to
lsb) all previous storages were wiped out. I was preparing myself for
the painful task of shipping it out for repair, when I fortunately
overheard a ham conversation on the air from a person who worked at
a place that sold ham-gear. He had heard something about "holding
down the WRITE button", while turning the transceiver on (initial
power-up). I tried it and IT CURED MY PROBLEM! Apparently, it resets
or initializes some logic??

Wow, I had no idea ... how does this work? I are they "cellular" in nature (the 15 or 20 don't overlap much)? This is a pretty good sort of "multipath" effect, how does it not foul up the receivers? (FM generates awful squeaks when you've got 2 comparable-strength x-mitters going at once)

IMHO it is arguments like this that blow all the credibility that the
PRO CW proponents have (and it isn't much to begin with.) Comparing
writing down the dots and dashes to trying to get a car with bald tires
inspected is just another case of apples and oranges.

How about comparing to an inspection station that says "I won't pass
your car unless it comes thru my doors with the manufacturers paper
stickers still in place on the the tread on all four tires. I don't
care if you just bought them yesterday." I would think you wouldn't
stand for that for a minute. But arbitrary and capricous behavior on
the part of a VE is OK??

Source record: 7752

I was just playing with a new toy our department bought for cable and line analysis, and I think it's got some real possibilities for amateur use. It's called a Cable Scanner, and it's designed for monitoring and analyzing ethernet, 3270, twisted pair, TV cable and other transmission line systems. While it has a number of functions, the one of interest is its built in TDR function. Playing around with a few spools of thin ethernet and 72 ohm coax, I discovered that the box can accurately locate shorts and open lines; it may even be able to locate impedance bumps; I don't know, as I didn't have the manual.

At $1595 (Inmac list price) it's a bit hefty, but hey, hams have been known to spend that on scopes. I wonder if perhaps there are cheaper models of this sort of box available?

In article <38017@ut-emx.uucp> oo7@ut-emx.uucp (Webster Smogpule III) writes:
}jerry@altos86.Altos.COM (Jerry Gardner NJ6A) complains (I think):
}--------------
}>>Obviously, he means W1AW, which, for most intents and purposes, IS a
}>>shortwave broadcast station that happens to broadcast on ham frequencies
}>>using paid operators.
}-------------

I wasn't complaining, rather, I was merely stating the facts. For the
most part, W1AW is a broadcast station. There are times when guest
operators and staff use it for two-ways, but mostly it's used for bulletin
and code practice purposes. It's also a fact that the bulletin and code
practice transmissions are conducted by paid operators for whom the ARRL
had to get a special dispensation from the FCC.

I think W1AW does serve a useful function (I copy the CW bulletins every
night) and should continue. There are those who wish, however, that the
W1AW operators would listen on their transmit frequency before cutting lose
with a bulletin or code practice session. I'm not among that crowd, since
the W1AW schedule is published well in advance and I *know* exactly when and
where they'll come on frequency and will avoid those frequencies.

}There sure are a lot of complainers on this 'ere net - if some of you
}spent as much time reading the license manuals and listening to CW as
}you do complaining about things here, you'd all be Extra class ops by

1831. NEW CANADIAN STRUCTURE--SOME GOOD NEWS!

Newsgroup: rec.ham-radio
Date: 1990-10-09 18:00:51 UTC
From: 51160_1477@uwovax.uwo.ca
Message-ID: <7340.2711d814@uwovax.uwo.ca>
Source record: 7767

I was concerned to read the postings about our new licensing structure.

The following information was obtained from our Department of Communications enforcement officer today:

1. NO PERMIT WILL BE NEEDED BY US AMATEURS TO OPERATE IN CANADA although other foreign hams will need a permit rather than simply a letter of
authorization as is now the case.

2. The deregulation of the subbands has been planned for many months as
part of their plan to achieve more amateur self regulation.

3. Basic licensees will not be able to use commercial equipment modified
for the ham bands. However, since commercial gear is very expensive, this
shouldn't be too big a deal. It would just mean going for a higher level
of license if it was important.

4. The question of POSSESSING either more powerful equipment or equipment that will transmit outside of the ham bands remains unchanged. They are
not concerned unless you TRANSMIT with it. Besides, they have more serious
problems that looking for hams with this type of equipment and will only
be concerned if there is a complaint.

5. Tower approval will have to be sought from local authorities but this
does not have to be a permit or license unless the municipality so
designates. They are looking for more responsibility from radio
operators to ensure that antenna supporting structures are reasonable
in appearance as well as technically sound.

Hopefully this helps to clarify some of the points and presents a more
positive view of what (generally speaking) is an excellent improvement
for the amateur community.

1833. Alinco DR-590T

Newsgroup: rec.ham-radio
Date: 1990-10-09 18:32:40 UTC
From: szarekw@LONEX.RADC.AF.MIL
Message-ID: <9010091832.AA29639@lonex4.radc.af.mil>
Source record: 7768

I just picked up a brand new Alinco DR-590T and have had some problems that I would like to share with you all out there in ham-net land. Maybe someone out there can help me with a couple of these problems.

1, I got this unit because of all the cool features it is supposed to have, including cross-band repeat. The instruction manual does not even mention this feature. After calling Alinco I found that this was a feature functions only after modification. They said (more than a week and a half ago) that they would send me the modification instructions. I haven't heard anything from them.

2, The Autodialer (an option for the 590E according to page 13 of the manual) did not work as in the insturctions. Another call to Alinco and I found that it is also an option in the 590T. On page 19 it was pointed out to me is a note to this effect. These instructions are also unclear. Anyway I went out and purchased the required DTMF unit and installed it. Now I can store the numbers in the autodialer's memories, however I cannot get the rig to autodial any number except the number stored in memory #1. I have tried every possible interpretation of the directions on page 13 of the manual and had no success. Another call to Alinco . . . they told me that they knew that the manual was written in jinglish (japanese/english) and was hard to understand. They said that they would send me a complete manual written by someone who spoke english as their primary language. I asked them why this manual was not provided with the rig and they said that it was free to anyone who asked for it ?!?!

3, This rig is supposedly able to receive DTMF codes from another transmitter that will allow remote control of the rig (useful as a very flexible cross band repeater). I have not been able to get this to function on my rig at all. I can only hope that possibly the modification they promised to send me will enable this function or that the new english directions will beable to explain how to make this happen. This function is the main reason I chose this rig since it will allow me to access local repeters from my office via 440 link.

4, The remote page/DTMF squelch function are completely cryptic I hope they are also explained in the english directions.

Anyone with any mods or operation instructions for this rig please let me know. Am I the only one with these problems? Does anyone have any solutions? Is Alinco always this slow? etc.?

I will post a summary when a solution is found
so send responses to me at my address:szarekw@lonex.radc.af.mil

>W1AW was just extensively (and expensively) renovated and operates
>using top-line commercial-grade radio and computer equipment.

The ARRL bought Harris RF-3200 HF radios for W1AW. The 3200 is a new design at the <bottom> of the Harris line. They sell for about $3500, which is near the top of the "ham" HF price range. Some of their logic was that Harris is not likely to drop the radio after 2 years and create a spare parts "vacuum".

> I love the idea of a multiplayer Amateur Radio game.

I have spent a good deal of time working on and supporting MUD's (Multi User Dungeons) Although the term 'Dungeon' can be misleading, the idea is that a MUD is a multiuser game like the text adventures in which players can interact with each other.

I would be very interested in working on a multi-user game under packet. I am a licensed ham, but I am not (yet) on packet.

If someone would like to work on this I would be glad to contribute my expertise in multiuser games if someone would like to help me with the packet radio aspects.

I can be reached by mail at cmoore@hprmokg.hp.com.

]
]Then it ain't "automatic".

No, but a phone patch does handle 3rd party traffic, requiring a control operator. However, I believe that a patch is legal if, when the control operator is not present, only 911 or equivalent can be dialed. This is on the theory that a 911 call is a presumed emergency and hence the third party traffic rule is waived.

> 73/Lee, N5LYT

The good news is that the ARRL offers a group liability policy in addition to the better known equipment policy. The bad news is it will cost you around $500/year. The same agency (Woehlers, I think) and carrier (CIGNA) are used for both policies. Contact the ARRL for details.

The astronomical number of forms of the questions solves the problem of
people memorizing the questions. It does not make the subject harder.

> Phil's posting was eloquent, but very long. Even though it was addressed
> toward me, I am not going to comment on more of it...it's just too long,
>
> I still think it was too bad that the original poster, a newly licensed

But remember it was not me that did the original flaming.

Now when you get a posting like this:

> I really started to love CW after I was 'forced' to use it with a
> novice ticket. Actually, I would rather use CW than voice any day.
> It kind of grows on you. Wait till you get a TNC.....
>
> Jeff NR0D

you might find it hard to argue against. I wonder how many hams who
use CW now would have avoided the CW test if that were an option.

>Anyone out there have any information, descriptions, reviews or comments on th
e
>ICOM's R1 and R100.

I have an R-1. Here is a very brief review:

Convenience, size - excellent
Ergonomics, features - very good
Sensitivity (25-900 mHz) - good to very good
Selectivity - good to poor

The biggest performance problem is the tendency to pick up images of strong
signals exactly 150 or 300 kHz away from the signal you're trying to hear.

PS: It is now with me ALL THE TIME, faults and all.

1845. ITU Station 4U1ITU - This Week's Schedule

---

___DEX, THE K3EKA SECRETARY, OPERATING 4U1ITU IN GENEVA

The secretary of the VOA Amateur Radio Club, Dexter Anderson, is
in Geneva and he is operating the ITU Club Station, 4U1ITU.

For all you DXers, 4U1ITU is considered a separate country for
DXCC purposes.

Dex plans to operate on 10 meters USB on frequencies between
28.400 MHz and 28.416 MHz on October 10, 11 and 12 between 12:30
PM and 1:30 PM EDT.

Sorry for the late notice. Good luck!!

The same one that cellular calls are routed to. Does your system just route
cellular calls to a random/arbitrary jurisdiction? Cells don't align with
the jurisdictions unless we have solved some problems in the physics of
radio waves I have not heard of.

> > You should at least make sure that the dispatching computer knows the number

What 7 digit equivalent? Where does it go to?

It definitely sounds like there is a management problem there. Maybe you
could get better response through the local TV media. They eat stories
like that for lunch.

* 97.403 Safety of life and protection of property.
*
* No provision of these rules prevents the use by an amateur station of
* any means of radiocommunication at its disposal to provide essential
* communication needs in the connection with the immediate safety of human
* life and immediate protection of property when normal communication
* systems are not available.

As I read this rule, it tells me that my amateur station (and it remains
in the amateur service) is not prevented by other rules (such as limits
on frequency or power) for radio communications under specific circumstances
it mentions.

So my radio is not type-accepted. It does not need to be type-accepted in
order to EXIST. That requirement applies to use in the Land Mobile service.
If it is there, it falls under "any means of radiocommunication". If the
other "normal communication systems" are not available (e.g. no cellphone
here, and no repeater locally that has an autopatch), that that fits another
requirement. Of course there must be a real emergency, too.

You're probably right.

> BUT... any equipment used on police or other non-amateur
> frequencies MUST BE type accepted. Using modified ham gear outside
> the ham bands is ILLEGAL, no matter how many public-spirited EMTs and
> others are carrying them on their belts.

Right again. But mere OWNING or CARRYING such radio is not a violation. And the regulations (I guess that is a law, even), state that in case of emergency etc. every citizen is REQUIRED to do anything that can be done (with the exception of putting oneself in great danger) to save a human live or considerable amount of public or private property.

Your bias may be different. To us, people's lives come first, not the rules.

Luru

1850. Re: Calling the cops by radio (was

Newsgroup: rec.ham-radio

Source record: 7748

Note that this sort of thing is encouraged (or at least allowed) between
certain agencies.

One example that I know of in NYC where
1) NYC-EMS radio's are equipped with the police frequencies
for the surrounding areas (the new sabers are equipped
with the entire city)
2) EMS units that do not have police bands on their radios can go
to the local police station and sign out a radio.
3) NON-OFFICIAL AMBULANCES (such as volunteers) can
go to the station and sign out radios.

This provides for a faster response to most ambulance calls (as with the
exception of during police emergencies, where no other calls are put out,
the police dispatchers are always ahead of the EMS dispatchers) and also
allows for quick multiple agency notification in case things get hairy.

The units are generally identified as just "EMS" on the air, with no specific
unit mentioned. This is generally true of the Volunteers also.

Another possible way to get intouch with the dispatcher is to use the
notation "XXX Portable" where XXX is the police precinct where the
event is happening (assuming you are on the correct frequency).

While the above methods do work, they are not really intended for civillian
use.

I don't follow this part. All radio transmissions in a Public
Safety system should be taped. I am not aware of any agency in my
local area that does not tape radio traffic. Do policies on this
differ in other areas?

1855. of skydiving and radios

Newsgroup: rec.ham-radio
Date: 1990-10-10 03:23:18 UTC
From: rr2v+@andrew.cmu.edu
Message-ID: <kb4dEaq00WB2AMtl4v@andrew.cmu.edu>
Source record: 7757

I could use some suggestions, comments, or advice.
Does my dream radio system exist?

I am totally blind and happen to be an avid skydiver.
One of the major problems I have encountered over the years has been
with radio systems. I am currently using a police scanner type set up belonging to the
drop-zone where I jump, but would like to invest in my own gear.

The ideal system would be something like this;
It would have to be somewhat protable, able to be worne inside
a jumpsuit, mounted on the parachute harness across my stomach, or
mounted directly to my crash helmet. As far a size goes, remember that some jumpers jump
with

jumpers jump with video cameras mounted to their helmets.
The radio should be two-way with a voice activated mike
and a speaker that could be mounted inside the helmet.
The mike would have to be able to cancel wind-noise up to about
30mph, this is only to be used once my canopy is opened.
I do not think a freefall system is possible.
The range would have to be no less than 2.5 miles.
And most importantly, it must be very reliable. I have already found myself
several times, under canopy at 2,500ft with no communication
with my ground suport.

Please send any suggestions or information to me here.

Thanks
Dan Rossi

Are you a licensed ham? Does ICOM have any business selling
transmitters to you and your friends? Not that they care. You hit
the nail on the head when you said "there's money in it, so they do
it."
I have always been against the policy that "every volunteer
needs a portable." There are a lot of non-licensed EMTs and vollie
firefighters running around with modified ham portables on Public
Safety frequencies. They and their illegal radios do not belong on
the air. I always thought a firefighter's job was to put out fires,
not to jabber on his portable radio.
Now we have the folks in this echo claiming that hams should be
able to transmit on police channels so they can call for help. That
is what telephones, repeater autopatches, fire alarm pull boxes, etc
are for. Civilians do not belong on the police radio, therefore they
do not need access to equipment that will transmit there.

> Rich Bono, if you are reading, THIS is the kinda guy I was
> talking about.

For your friend's benefit, THIS kinda guy has extensive Public
Safety emergency communications _and_ disaster preparedness
experience. The only way the system works under normal or emergency
conditions is if everybody stays where they belong.

Not all. Some cities do indeed have ONE dispatch center. Lack
of a common central dispatch office is politics, not effective system
design.

What makes you think your receiver's problem is caused by transmitted "crap"?
Intermod in your receiver is not caused by spurious emissions. And if you
have your TH215 hooked to any antenna other than the little rubber one that
came with it, the problem will be worse. Probably the paging transmitter
is putting out lots of power, but only on it's assigned frequency.

>----------

It appears to me that alot of the 'intermod' problems with the
latest HT's are due to the wide receive frequency range. I have
noticed a definite difference (sorry no quantitative measurements)
between my 'old generation' Yaesu and Icom HTs and my Kenwood TH 26.
I attribute most of this to the extended frequency coverage of the
Kenwood (138 to 174 MHz). Although I have not noticed the problem
on my Kenwood TM-231 which has the same receive coverage.

Anyone have similar experiences or maybe even hard data?

Message-ID: <901010000354.24001599@HG.ULeth.CA>
Source record: 7763

```
**********************************
*** GEOMAGNETIC STORM ALERT ***
**********************************

Issued: 23:45 UT, 10 October

-------------

Attention:

At approximately 23:57 UT on 09 October, a sudden magnetic impulse
(characteristic SSC-type signature) was observed at the magnetic observatory
near the University of Lethbridge. At approximately 02:20 UT on 10 October, a
Minor Storm level positive magnetic excursion occurred locally. The magnetic
field has since been fluctuating at Active to Very Active levels and it is
believed that at least Minor Storm level fluctuations may begin at any time.
It is not known whether the main phase of the storm has yet begun (or if it
will materialize at all), although it is anticipated anytime now. The potential
storm intensity is not expected to exceed Minor Storm levels at low and mid
latitudes, however activity at higher latitudes (and possibly northern middle
latitudes) could reach Major Storm levels over the next 12 to 24 hours if the
storm reaches maturity.

Radio propagation conditions are expected to be Very Poor over high
latitude paths. Paths particularly susceptible will be those which pass
through or near the auroral zone, which may shift southward over the period due
to the storm conditions. Southern middle latitudes and low latitudes should
maintain Fair to Good propagation conditions throughout the period, provided
this activity does not exceed anticipated levels. Fading will be more
pronounced on most HF frequencies and may be quite severe over high latitude
paths. High latitude paths can also expect increased signal absorption due to
auroral activity. Some auroral propagation may be possible over higher
latitudes where auroral activity is more pronounced.

Auroral activity will reach High levels over high latitude paths and will
be visible from northerly middle latitude locations. Mostly moderate activity
should prevail at middle latitude locations. Low latitudes will,
unfortunately be unable to witness the auroral activity unless storm levels
become significantly more severe than currently anticipated. An additional
alert will be posted if activity exceeds levels currently anticipated.

The following forecast charts have been modified to reflect the recent
increased geomagnetic and auroral activity:

REVISED FORECAST OF GEOMAGNETIC ACTIVITY

days. Sunday on the chart represents 07 October.
* = Predicted auroral activity for the remainder of the period.

SUMMARY OF ACTIVITY TO 05:50 UT ON 10 OCTOBER

The geomagnetic field continues to fluctuate at Active levels, interspersed with periods of Unsettled activity. It is possible this activity may only be momentary and may not attain a storm classification. However, it is still believed that the geomagnetic field will maintain Active to Very Active conditions with sporatic bursts of Minor Storming. If this activity should materialize into a full fledged major event, an additional alert will be posted.

Please send any reports of degraded radio conditions as well as sightings of auroral activity to the address below. Please include a brief description of the type of conditions observed, your location (approximate latitude/longitude) and the time of the observation(s) in Universal Time.

If reporting degraded radio propagation conditions, please specify the path(s) attempted and the type of interference encountered (ie. strong fading, complete blackout, rapid fading, strong noise, strong signals, etc).

If reporting auroral sightings, please attempt to describe the type of auroral activity observed, it's dominant location in the sky, and approximately how bright the auroral activity was as well as anything else noteworthy (ie. visible pulsations, color fluctuations, etc.). If reporting auroral sightings, it would also be appreciated if you could state the local time that the observations were made, as well as the Universal Time of the observation.

ALSO, if any of you experience local power outages which you can be relatively sure were not caused by thunderstorms, PLEASE report them with information regarding the length of the outage, whether it was only momentary (ie. a few seconds) as well as the time of the event in both local time and Universal Time.

All reports will be used to improve forecast accuracy. Reports will also be used in impact analysis research which will also aid in improving forecasts. To all those who send in reports, thanks very much!

Send all reports to: std_oler@hg.uleth.ca

>points out, there is no reason they can't; they're just not scheduled for it.
>All the voice contacts we know about will be by sked, and that is not
>brain-dead, it's just their choice.

1. Please stop taking me out of context and mixing quotes, Patrick. I never said that the current arrangement is "brain dead". In fact, I think that reserving slots for the schoolkids is a very good idea.

2. Ron will indeed be taking calls from "J. Random Ham", but only as time permits. In any event, chances are you'll wind up with the robot.

3. My only substantial grievance here is that the slot allocations were not publicized, to allow the rest of us to schedule around them.

As to voice-activated microphones, we hang gliding folks have tried out a lot of different 2-meter radios in the past few years, and the only VOX that is not oversensitive to wind noise is the Yaesu brand voice-activated microphone. We're dealing with wind speeds from 20 to 40 miles an hour or so.

It may be simpler to use a push-to-talk switch.

You can mix brands, the VOX or PTT does not necessarily have to be the same brand as your radio. Make sure they work together of course!

As a newcomer to this newsgroup I'd like to re-ask a common question:

Wherefrom can I ftp ham-programs for PC, as QTH-locator-calculations,
list of QTHLOCS/LogLat-positions, etc etc. Computing distances between
Lat/Log or QTH-locs etc etc. ?

Sincerely yours

From: PJML@ibma.nerc-wallingford.ac.uk
Message-ID: <10.Oct.90.10
Source record: 7785

My point is that the designers of HT's should be aware of the presence of
the hostile RF environment, and design their products accordingly.
It would only take a 3-pole helical filter in the front-end to push all the
pager/FM-broadcast/local-police-repeater-on-image-frequency garbage
way down into the weeds... Your local Toko dealer will sell you
very nice filters for 6 dollars one-off cost; presumably Icom, Yaesu etc,
with their purchasing leverage could get them much cheaper;
Make the radio *slightly* bigger to fit one of these
0.7 by 0.5 by 1.2 inch filters in, if it actiually made the radio usable,
I would happily give up crossband-repeat, 20 memories and scanning if it
got the filters to fit.
Instead, i would have to fit the filter in a small project-box and hang it
on the radio with a length of coax and BNC conns....!

From: paul+@andrew.cmu.edu
Message-ID: <Mb4kyey00Uh-80m0kw@andrew.cmu.edu>
Source record: 7774

I am trying to put together a collection of TS-940S modifications.
If you have something of interest, please E-MAIL me direct. I don't want
to clutter up the net with postings. I am looking for news-letters,
mods, undocumented info other than whats in the Kenwood service manual.
In particular, I would like information about the RS232 port, and the
commands that the 940 will accept through the port.

Thanks

Paul

>> 20 transmitters all belching out 250 Watts in simulcast.
>>Wow, I had no idea ... how does this work?

>The transmitters are NOT on the same frequency.

The transmitters <are> on the same frequency for a given system. I've never known anyone to have to change digital pagers as they moved around in one continuous service area.

Our transmitters all have ovenized oscillators so that no two stations ever vary by more than 50 Hz. Some systems use disciplined oscillators linked to an outside source. That takes care of any squealing at the receivers -except for 50 Hz, which can be ignored (like PL). Each transmitter is connected to the paging terminal by a designed (non-switched) circuit. An adjustable audio delay network at each transmitter assures that they all transmit the same bits at the same time. All that is left is bit spreading at the receivers due to the arrival of 15 RF signals from different distances. That helps limit the data rate (given standard +/-5KHz deviation).

There is a <lot> of signal overlap. That is why a maintenance man in sub-basement 3 of a 50 story building still gets his page with reasonable reliability.

Swan was bought by, taken over by or somehow became the same as Cubic Communications, Inc. Cubic continued to produce ham gear for a few years and then switched to production of "government" electronics. They still honor some requests for parts and manuals.

Just wondering: Just what is involved in getting a radio "type accepted" anyway? Design it to meet some design rules, like the user can't make it transmit out of band or too much power? Send the design, or even a sample to some FCC test lab? Or just pay an application fee? If cheap enough, and easy enough, someone could get a modified Icom u2AT type accepted. So you EMTs with them would be legal? (didn't think so..),

In a recent Digest, someone (my $?%#$% terminal lashup won't let me include the relevant article from here) said that they didn't believe that individual firefighters needed handhelds.

The EMS I belonged to until recently had an ironclad policy: every member had a handheld, and they were not to respond on calls without it, ready to use. This was a safety issue: it was felt that they needed the ability to call for help immediately upon encountering a situation they couldn't handle. This policy saved numerous injuries and other problems. Many progressive fire departments are doing the same for firefighters, for many of the same reasons. You may be certain that my IC-02AT was available for backup to my EMS radio - for if I needed it, it was an emergency situation, and my EMS training taught me to look out for myself first, and damn regulations that get in the way.

I believe the original poster, who asked how to get his IC-2SAT to do a 6.46 MHz offset, may well have been trying to use his radio in one of the MARS or CAP services, which have inputs and outputs spread across the 2 meter ham band. The original flame (from the same FidoNet newbie that I'm responding to) was completely uncalled for.

It sounds like they need a little more of a "kick" in the butt to enter
the information. I'm not sure which 9-1-1 they've got out your way, but
if it's anything like the one I work on (I'm a developer of enhanced 9-1-1
systems), it's got free-form text locations that can be linked to a particular
ALI record. I would suggest that you try to bypass the phone company and
find out who the administrator of the 9-1-1 system is (it's usually a
separate sub-group); he (or she) should be able to manually enter ALI
data with you right there on the phone. It's definitely worth the
trouble.

It's amazing how little we seem to know about the services that operate around ours. When I saw the 6.46 Mhz split, the first thing that popped into my mind was CAP. I don't know of any other services that use wierd frequencies. I know that MARS is an odd split, but their's is about the minimum they could run and stay out of the ham bands.

On a brighter note, did anyone see the segment on phone-patching from Operation Desert Shield on CNN yesterday evening. It's about time we see a ham on the news in a good light. maybe there is hope for Amateur Radio yet.

1877. LO-JACK

Newsgroup: rec.ham-radio
Date: 1990-10-10 14:33:58 UTC
From: Pete_Simpson@dgc.ceo.dg.com
Message-ID: <9010101533.AA00046@rtp40.dg.com>
Source record: 7810

CEO summary:
There seems to be some confusion as to the frequencies that LO-JACK operates on. Here in Mass., the transmissions are on 173.075 and sound a lot like packet. All the cruisers set up for LO-JACK tracking have a pattern of four 18" or so whips on the roof and a doppler DF setup inside. The beaconing car's ID code also shows up on a 6 (or so) character alphanumeric display. There have been a few news video clips of the system in action showing the cruiser display. I myself have also wondered how you locate a LO-JACK car inside an aluminum trailer truck, and why car thieves don't carry scanners tuned to 173.075???

Source record: 7786

I need some info on 2-meter FM & CB radios for a car (to use if the car should break along the road

I wish to install it in such a manner that it is easily removable, as my car is broken into frequently. Perhaps I can power it off the cigarette lighter.

1) what radio's do you recommend...where can I get good consumer ratings for variouse transcievers (this is particulary hard for CB radios---which is better, Cobra or Midland)????

2) what about antennas that can be easily removed each time I use the car. My car is vandalized regularly, plus, I would like to move the antennas to my room (maybe put them on a window sill) and use the radios indoors too.

I don't read this news.group regularly, so send me e-mail

Steve

seid@hyperion.ee.cornell.edu

thanks in advance.

The mod to unlock VFO will only work on radios with newer CPU. We tried it at HRO with an early model and it would not work. The one I know it works on has serial number over 010000. How does it receive AM? Beats me. But it does receive commercial aircraft transmissions 118-124 or so. Lots of other stuff on other bands if you want to take the time to search for it. What freq is cellular radio?

Which office did you talk to? The DOC Vancouver office has a completely different interpretation of this. (Not the first time that's happened.)

>3. Basic licensees will not be able to use commercial equipment modified
>for the ham bands. However, since commercial gear is very expensive, this
>shouldn't be too big a deal.

Are you kidding? Look at the price of a 440 MHz amateur transmitter from Kenwood/Icom/Yaesu. Now look at the price of the 450 MHz Pye commercial rigs we picked up for $5 each. (Yes, they work, and come with 120 V power supplies as well.)

>4. The question of POSSESSING either more powerful equipment or equipment that will transmit outside of the ham bands remains unchanged. They are
>not concerned unless you TRANSMIT with it. Besides, they have more serious
>problems that looking for hams with this type of equipment and will only
>be concerned if there is a complaint.

I expected a clarification on this was forthcoming. Let's hope all the DOC offices agree with this interpretation.

As far as monitoring (or enforcement in general) goes, you have to f*** it up pretty bad before the DOC will even begin to pay attention. They barely have enough staff to monitor their two "priority: services: public safety (police, fire, ambulance) and commercial broadcasting.

With all the talk of the 75S series and others, I haven't seen on mention of the 51S-1 receiver. Unfoutunately, I don't remember too much about it except that it covered 3-30 mHz with out extra crystals, had all the necessary jacks and connectors on the back for hooking up to another radio (transmitter) and as far as I was concerned at the time, one heck of a fine receiver. I used it with a monopole antenna and another Collins transmitter of URG vintage. That's a long story in and of itself. Anyhow, all this was about 10 years ago, but if I was looking for a Collins receiver, especially for full coverage use, I'd sure look for a 51S-1.

73 and Good Luck,
Michael

How is the Harris line defined? If "top of the line" means a megawatt
of output power, then it certainly wouldn't be appropriate for W1AW.

Just out of curiosity, how old was the gear they replaced? Was it
rendered unsuitable because of parts unavailability?

1886. Re: Calling the cops by radio (was Re: performance of QRP)

Newsgroup: rec.ham-radio
Date: 1990-10-10 20:17:36 UTC
From: mikew@hpsad.HP.COM
Message-ID: <1530054@hpsad.HP.COM>
Source record: 7809

I have used my non-type-accepted ham radio to call a fire dispatcher directly on two occasions that I can remember; once to call in a car vs. bicycle accident with injury, and once to cancel 7 engines that were racing to a wildland fire that had been extinguished. In both cases I was unable to access the local autopatch machine on 2 meters.

I strongly believe tha Part 97.403 fully supports these calls, and I would certainly do it again.

Note that I am VERY familiar with the radio protocol in use on the fire channel (as a legitimate user), and that most of the people on the "other end" know who I am. I have also checked my radio to be within commercial specs for frequency tolerance, off-channel signals, etc., so that I am not causing havoc to other users. I have never followed up a call with reports to the agency and to the FCC, but that wouldn't be a bad idea in the future.

Please be REEAL careful if making a direct call: you can cause more harm than good if you interfere with some other emergency. Remember that almost ALL traffic on these channels is emergency priority. Also take steps to ensure you don't mistakenly key up on a PSA channel thinking it is your favorite repeater... I store fire channels in my radio with the transmit frequency offset to an unused ham channel-- I figure I will need to transmit so infrequently that I can turn off the offset if the need arises. This also deters malicious use by somebody steals my radio (provided I don't wring their little necks first...)

> ...most anybody can learn code if they try.

Can I twist that a bit? "Most anybody can learn tree climbing if they try." Gosh, that sounds like sufficient rationale for making it a requirement for a ham license. Doesn't it? After all, any decent ham will want to climb a tree to put up an antenna.

Whoa! Many hams have no reason to climb a tree in the pursuit of the hobby. Uh... How many hams need morse code to pursue the hobby?

The issue is NOT whether it is LEARNABLE, but whether it is RELEVANT!

I find code reasonably easy to learn... and to forget if I don't use it... which I don't. I think it's a crummy licensing requirement. It is NOT RELEVANT.

> ...Kenwood TH-75A solved the problem by providing three "special" memory
> locations which can take oddball splits (out of a total of 10).

The Yaesu FT411 does the same for all memory channels. It works the
same way. Merely hold PTT while storing the frequency. This is useful,
for instance, to store a "safe" (in-band) transmit frequency with
various out-of-band receive frequencies. The display shows "-+" (both
the "-" and "+" splits) to indicate the oddball situation.

Of course, you can quickly press RPT to turn off the split, same as
rotating "-" / "+" / none. Dial off and back to the memory channel, and
the split is restored. Nice!

Whatever else people say in derision about my "portable pinball machine
radio", it has some good features like this.

They are in my neck of the woods. The signals are carefully
phased so that the receiver hears what sounds like only one signal
without the phase distortion that would normally be caused by
multipath reception.

Exactly. But we have gone from the reasonable view of being
aware that you can use your transceiver (or anyone else's) outside
it's normal legal operating limits in certain kinds of emergency to
going out of our way to make the radio capable of being used illegally
just in case such an unlikely catastrophe were to occur to us.
A lot of people, with and without ham licenses, have
demonstrated a lack of self-discipline as far as not using such
capabilities if they have them available when there is no emergency,
or when the circumstances do not justify invoking the rule you quoted.

The salient point here is that this arrangement is by agreement
between different Public Safety agencies. It does not apply to
civilian radio equipment which happens to be capable of the same type
of frequency coverage. The radios are owned by the City of New York,
and issued either to NYC-EMS or NYPD.
I note that you made a similar point at the end of your message,
so I'm not arguing with you.

My _personal_ bias is the same. However, it is demonstrably
true that there are people who feel they MUST find an excuse to use
those radios if they have them. If the only time a ham transceiver
was used on a police channel (or fire, or EMS) was a true emergency,
there would be no problem and no argument. This is just not the case
here.

Your EMS agency had that policy. Fine. The EMS agencies in my
area don't have such policies, especially when it comes to PRIVATE
ownership of transmitters. In fact, having everybody and his brother
equipped with a portable can be an extreme annoyance to central
dispatch. It is also a hazard during major incidents, when only a
handful of people NEED to be on the air (Triage, Command, Operations,
Staging, etc. - not EVERYBODY).

> - for if I
> needed it, it was an emergency situation, and my EMS training

Fine for you. Perhaps YOUR training has taught you something of
value, and perhaps YOUR sense of self-discipline will keep you off the
PS bands with your ham radio during routine situations. But I invite
you to visit the Rochester, NY area sometime and count the modified
IC-2s and IC-02s and other rigs by other manufacturers that are being
carried AND USED daily by people who are not licensed amateurs. Even
the ones who have positions requiring the use of an individual radio
have no business utilizing a non-type-accepted ham rig as that radio!

> I believe the original poster, who asked how to get his IC-2SAT to do a 6.46
> MHz offset, may well have been trying to use his radio in one of the MARS or

He specifically stated that he was trying to use a non-amateur
repeater. People who want CAP and MARS mods usually say so.

> The original flame (from the same FidoNet newbie that I'm
> responding to) was completely uncalled for.

I disagree strongly. And I don't think 2 years in FidoNet and 7
years in Public Safety communications plus 9 years as a licensed ham
qualifies me as a "newbie."

>
>Jeff Hite

Since you asked, Yes I do and for the price it's a real steal!

It's called MacSat and it's a steal for $10. I've compared the output
with the stuff churned out by the mainframe at work and the accuracy
is excellent. It allows direct input of NASA 2 CARD ELSETS (found in
this same news group) or the painfully slow manual AMSAT format. I
have used it with a 512KE, a Plus, a Mac SE and a Mac ll. I haven't
heard from thompany in a while (4 months) but I believe it's
still in business. The address is listed below.

B E K Delevopment
1732 74th Circle NE
St Petersburg, FL 33702

I used MacSat 1.1.3 on all machines and MacSat2 1.1.3 on the Mac ll.
Give me a shout if there are amy more questions.

>
> As I read this rule, it tells me that my amateur station (and it remains
> in the amateur service) is not prevented by other rules (such as limits
> on frequency or power) for radio communications under specific circumstances
> it mentions.

I interpret the above rule in a different manner.

I believe that this and other amateur radio rules and regulations
must be interpreted in the *context* of their application to the amateur
radio service. As I see it, the above section relaxes the rules pertaining
to amateur radio operation in the event of an emergency, but *only* as they
apply to operation within frequencies allocated to the amateur radio
service. As an example, in the event of an emergency a novice or technician
class licensee could operate using amateur radio frequencies and/or employing
power and emission modes which they are not normally entitled to operate.

Therefore, the above referenced rule is not carte blanche permission
for an amateur radio operator (in the event of an emergency) to operate a
radio station on *any* frequency from DC to light in any manner they so
choose. Since the above referenced rule is contained *within* the sections
pertaining to amateur radio operation, it could only pertain to those
frequencies allocated to amateur radio operation.

In support of my interpretation, consider some wording contained
within 47 USC 301 (which relates to general provisions for FCC license
requirements): "... no such license shall be construed to create any
right, beyond the terms, conditions and periods of the license." Part
of what this means is that a license for one service cannot create any
rights for operation in *another* service.

I have seen the results of judicial review of other kinds of rules
and regulations, and I would bet money that judicial review of the above
exemption contained in the amateur radio service rules and regulations
would result in a decision on the order of: "Mere possession of a valid
amateur radio license, even in the event of an emergency, does not
convey a special class or privilege apart from that of other persons not
so licensed, as to permit the unlicensed operation in any *other* regulated
portion of the radio spectrum."

I realize that there are readers of this newsgroup who will rather vehemently disagree with what I have just stated, but *think* about this question for a moment before replying: Do you really believe it is the *intent* of the FCC that the holder of a novice class amateur radio license be granted some magic privilege to use any part of the radio spectrum they so desire in the event of an "emergency"? If so, where would one draw the line? How about using say, 121.5 or 243.0 MHz to report a traffic accident? That'll get some attention quick-like! If we are to take the "literal" interpretation of the alleged exemption, such frequency usage would be acceptable!

It is my belief that should an amateur radio operator actually utilize a public safety radio service channel without specific prior authorization to report an "emergency", there would be no choice but to make some *considerable* effort to prosecute such amateur radio operator. To fail to make such a prosecution would set a precedent that would no doubt be *very* disturbing to public safety authorities.

97.205 Repeater station.
...
(e) Ancillary functions of a repeater that are available to users on the input channel are not considered remotely controlled functions of station. Limiting the use of the repeater to only certain stations is permissible.
...

However, non-repeater autopatches are very different. There are TWO stations involved. The base/remote station operates under remote control but is otherwise and ORDINARY station and can operate on any frequency, and in any mode, that the control operator and the station licensee is authorized for. The station of the USER is the auxiliary station. It has to be operating as an auxiliary station in order to remotely control a station. FCC rules require auxiliary stations to operate on 220.5 MHz and up, except on 431-433 MHz and 435-438 MHz. So the INPUT to an autopatch must be on those frequencies only. The OUTPUT can be anywhere else that is legal.

Note that if the OUTPUT is on 29.6 MHz, a Technician cannot be the control operator. A Novice cannot operate an auxiliary station at all, so therefore cannot use the autopatch unless someone else is acting as control operator.

Simplex autopatches on 2 meters are therefore not legal as described here because the auxiliary station would be on 2 meters and that is illegal, or the autopatch would be operating under control of a non-auxiliary station, and that is illegal, or there is not control operator, and that is illegal. This does NOT affect autopatches as part of a repeater because the control of the autopatch is under control of the repeater, and the connection of that control is wireline (usually). If it were not wireline, then the control link would have to be auxiliary.

A full duplex crossband autopatch can have its OUTPUT on 2 meters, but NOT its input. With so many dual band 2m/70cm radios around, such an autopatch

with an OUTPUT on 2m and an INPUT on 70cm (except 431-433 and 435-438) would be the way to go. Putting the input on 222.1-223.91 MHz might temp Novices to use it, and that would be illegal.

Auxiliary stations must be under control of a control operator at a control point. But they may be under remote control via another auxiliary station to achieve this control. Eventually there is a live control operator.

An auxiliary station may be automatically controlled only when it is part of a system that includes a repeater station also being automatically control. (97.201(d))

As long as you can hear the 147.225 machine when it goes on the air, you could add a CTCSS tone to the TRANSMITTER on 147.225 and when you are using one of the newer HT's that has tone squelch, you can squelch out the intermod.

> not to jabber on his portable radio.

There are type-accepted portables available, and even Icom sells them.
Some are actually very cheap, too, so the cost is not the issue. I don't
know why one of these people would want a ham rig just to get a cheap
radio on their public service band. There are cheaper radios advertsied
in "Mobile Radio Technology" magazine.

> Now we have the folks in this echo claiming that hams should be

> is what telephones, repeater autopatches, fire alarm pull boxes, etc
> are for. Civilians do not belong on the police radio, therefore they
> do not need access to equipment that will transmit there.

I am not claiming that hams SHOULD be able to transmit on police channels,
but I am claiming that hams ARE able to transmit on police channels. I am
also claiming that certain FCC rules allow this transmission under certain
circumstances (like a real emergency).

Which would be cheaper? Getting a portable cellular phone with service,
or adding an autopatch to the local repeater with a phone line. DON'T
ANSWER ON THE NEWSGROUP HERE, just send me your check that covers the
cost for one year of whichever one you think I should have instead of
my current IC-32AT with out of band mods in place.

From: phil@ux1.cso.uiuc.edu
Message-ID: <30500771@ux1.cso.uiuc.edu>
Source record: 7817

Yes, Michele did see "ear" in 97.503, which shaved a few seconds off me looking for it. But I will copy it here:

] 97.503 Element standards.
]
] (a) A telegraphy examination must be sufficient to prove that the
] examinee has the ability to send correctly by hand and to receive
] correctly by ear, texts in the international Morse code at not less
] than the prescribed speed, using all the letters of the alphabet,
] numerals 0-9, period, comma, question mark, slant mark, and pro
] signs ar, bt and sk.

So, how many would go along with petitioning the FCC to change just the above paragraph to: [new text in all caps]

+ 97.503 Element standards.
+
+ (a) A telegraphy examination must be sufficient to prove that the
+ examinee has the ability to send correctly by MANUAL MEANS and to
+ receive correctly WITHOUT THE BENEFIT OF DECODING DEVICES, texts
+ in the international Morse code at not less than the prescribed
+ speed, using all the letters of the alphabet, numerals 0-9, period,
+ comma, question mark, slant mark, and pro signs ar, bt and sk.

This would ALLOW a device that turns on a light when it hears a sound because such a device would not be decoding the Morse code.

> linear amplifiers (even kits!) manufactured for the amateur radio market
> then, without the process of type acceptance?

The rules in part 97 are there to limit the number CONSTRUCTED by hams so
that there is no loophole to the REAL restrictions on linear amplifiers
elsewhere in the FCC rules which prohibit manufacture, importation, sale,
etc. of such equipment.

I have read in some law books that many states of laws that allow a restrictive covenant to be removed if you act in such a way that violates that covenant and no one complains. I have read that an example timeframe is about a year. See your lawyer BEFORE you do this. I posted this just to let you know that in some case there can be hope, and that you should see your lawyer to find out about it.

You are choosing to interpret 97.403 as waiving some rules but not others.
Tell me how you come to believe that one rule is covered by 97.403 and not
some others. How do you decide WHICH rules are to be waived?

> Therefore, the above referenced rule is not carte blanche permission
> for an amateur radio operator (in the event of an emergency) to operate a
> radio station on *any* frequency from DC to light in any manner they so
> choose. Since the above referenced rule is contained *within* the sections
> pertaining to amateur radio operation, it could only pertain to those
> frequencies allocated to amateur radio operation.

Sure, it is contained WITHIN amateur rules. The rules limiting the power
and the rules limiting the frequency are BOTH present in part 97. How
do you decide WHICH rules can be waived and which ones cannot?

> In support of my interpretation, consider some wording contained
> within 47 USC 301 (which relates to general provisions for FCC license
> requirements): "... no such license shall be construed to create any
> right, beyond the terms, conditions and periods of the license." Part
> of what this means is that a license for one service cannot create any
> rights for operation in *another* service.

Reread my original posting:
As I read this rule, it tells me that my amateur station (and it remains
^^^^^^^^^^^^^^
in the amateur service) is not prevented by other rules (such as limits
^^^^^^^^^^^^^^^^^^^^^^
on frequency or power) for radio communications under specific circumstances
it mentions.

So as I am interpreting it, if I were to operate this way, I would still be
operating AS AN AMATEUR and as part of the AMATEUR SERVICE, in communication
with a station in the LAND MOBILE PUBLIC SERVICE. I would be using 97.403 to
waive 97.301. You mention the possibility of waiving only parts of 97.301,
and all of 97.313 and 97.305 through 97.311.

I have seen the results of judicial review of other kinds of rules
> and regulations, and I would bet money that judicial review of the above
> exemption contained in the amateur radio service rules and regulations
> would result in a decision on the order of: "Mere possession of a valid
> amateur radio license, even in the event of an emergency, does not
> convey a special class or privilege apart from that of other persons not
> so licensed, as to permit the unlicensed operation in any *other* regulated
> portion of the radio spectrum."

Were these judicial reviews all dealing with the case of an actual
emergency? If not, then I believe they won't apply.

By the way, there is no indication that 97.403 cannot also waive rules
97.5 and 97.7.

> I realize that there are readers of this newsgroup who will rather
> vehemently disagree with what I have just stated, but *think* about this

> usage would be acceptable!

First of all, I am not talking about an "emergency", I am talking about
and **EMERGENCY**!!!

You draw the line on common sense and what is actually necessary.
You cannot use the rule to transmit with 10,000 watts of power when
100 watts was clearly going to get the emergency communications through.

> It is my belief that should an amateur radio operator actually
> utilize a public safety radio service channel without specific prior
> authorization to report an "emergency", there would be no choice but to
> make some *considerable* effort to prosecute such amateur radio operator.
> To fail to make such a prosecution would set a precedent that would no
> doubt be *very* disturbing to public safety authorities.

By all means an investigation would be called for. But I do believe that if the correct actions were taken at the time of the **EMERGENCY**!! then cool and sane heads will prevail and no formal charges of rule violations would be applied. But it better be a real **EMERGENCY**!! and it better be the case that the particular rule "waivers" you took via 97.403 were actually necessary to conduct the communications within the time period necessary.

Larry, since you are so adamant about this, then I might suggest you petition the FCC to reword (or even to delete) 97.403 so it does not cover so many possibilities, so vaguely.

I believe they made it vague for a reason, and that being to not set in stone any particular "waivers" and to give the prosecuters and the judges some leeway in deciding cases.

The precedent I am afraid of is one where people WON'T use an available radio when it is absolutely necessary.

Considering the current downswing in real estate sales, we might be able
to gain a very slight bargaining position.

I know for instance that when I am ready to buy a house, the terms of by
offer will specifically spell out a number of restrictions that cannot be
in the contract or referred to in the contract of sale (so I can get by
offer money back if it turns out to be the case). For instance I want no
restrictions on things like:
1. Outdoor antennas.
2. Radio transmitters of any kind. [you better watch that one]
3. Swimming pools.
4. Gardens of any size on non-frontage.
5. Color of exterior paint.

> ham channel-- I figure I will need to transmit so infrequently that I
> can turn off the offset if the need arises. This also deters
> malicious use by somebody steals my radio (provided I don't wring
> their little necks first...)

Because the offsets on VHF frequencies are so odd and different, I am
afraid I might not remember them in the real emergency. I can remember
them at this moment:
154.070 +1.945
155.040 +3.885
but I might not when trying to overcome panic. So I have programmed
them in, except that I programmed them in the reverse direction.
All that I need to do is press the DUP key a couple times and I have
it set to go. The PL tones are programmed as well (though maybe I
should program them as OFF, but just program the frequency).

Thus my radio is less secure than yours in terms of malicious use by
someone who might steal it. But someone who just does not know these
things is not likely to get the DUP set correctly and then NOT be
tempted to spin the dial on top, which would wipe the settings with
the memorized values in the next channel. They'd have to be smart
enough to program the thing, and they'd be able to program whatever
they wanted then anyway. Of course there is the issue of having such
a fully programmable radio, but I believe that is a distinct issue.

hi out there,

recently someone asked for games implemented on packet radio. sri, i lost the originator's email address.
dd4os, boris, has written something for the dec rainbow as a game server a few years ago. maybe it works on ms-dos in general. i cannot really remember, what the game was like, it was something like a lunar landing simulation.
due to our links here in germany it was incredibly slow when used via digipeaters, but it worked well on point-to-point links.

if you like to contact him: boris is working at the ai-labs of the university of hamburg, frg.
his email address is pasternak@informatik.uni-hamburg.dbp.de

if you cannot get through, send mail to me, i will forward it to him.

good luck, bernd

It's not based on power but on features. There are more expensive
Harris units in the same power class.

> Just out of curiosity, how old was the gear they replaced? Was it
> rendered unsuitable because of parts unavailability?

That's not an easy question to answer because not all of the equipment
was acquired at the same time. Most of the equipment, however, was
"homebrew" stuff built in the 60's or early 70's. Some of the homebrew
kilowatt amplifiers had been replaced with ETO amplifiers (which were
sold off after replacement). The reliability and signal quality of the
existing system had degraded to the point where it had to be replaced
whether or not the building was renovated.

I'd be interested to hear from anyone running 7 stock amateur kilowatt
transmitters 12 hours per day year round. I'd particularly be interested
in their experience regarding reliability. That is the basis on which
the Harris equipment was chosen over the available amateur equipment,
along with a commitment to continued parts availability by Harris and
the availability of on-site service should we run into severe problems.
I suggest that those who argue that "if Kenwood/Ten-Tec/Yaesu/Icom is
good enough for me, it ought to be good enough for W1AW" simply haven't
considered all of the needs of running W1AW. (It's also worth noting
that all two-way operation from W1AW _does_ use stock amateur gear.)

Frankly, my first proposal was to build a state-of-the-art "homebrew"
system for W1AW. Management rejected that proposal because they felt
it would take too much of the lab's time. In retrospect, they were
probably right: I'm not sure we could have finished the Microsat
power control boards in time had we been completely engaged in W1AW
renovation efforts. (We _did_ spend a lot of time on W1AW, since we

designed and built the signal distribution/interface and control circuitry to tie the system together, along with writing the software to run the thing.) Once we decided to go with off-the-shelf equipment, a request for proposal (RFP) was issued to a number of equipment manufacturers, including all of the amateur manufacturers. The decision to go the Harris route was made on the basis of the responses to the RFP and it was not made lightly. (I should point out that Harris cut us a nice deal, as well.)

Finally, I'd like to point out that the W1AW renovation was paid for with funds freely donated. It's not as though the money came out of your membership dues. The people who donated money did so because they want a first class W1AW. That's exactly what they got.

1915. Re: deed restrictions

Newsgroup: rec.ham-radio
Date: 1990-10-11 13:37:50 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <9010111337.AA00390@cmr.ncsl.nist.gov>
Source record: 7901

IMHO, this subject hits on the most serious threat to amateur radio; at least when coupled with the economic situation that forces most younger families into apartments or row (town) houses. Why should I get a ham license if I can't put up good-enough antennas to really be able to work much? If my rig/antenna is 3 meters from the neighbor's TV, I'm asking for trouble.

There isn't much that the amateur community can do about the cost of housing, but we (and our League) should do our best in beating back restrictive sales conditions. How??? Dispite the odds against us, the League should keep up its work toward getting requirements for broadcast receiver overload performance.

Just my thoughts ....

Bob W3OTC

Yes? No! Yes! NO! YES!!!

Well, I suppose you rather watch someone die because you don't think
it is permitted to call help. Ehmm..?

Especially here in Finland, getting a QSO to a fellow ham may be
difficult due to long distances between repeaters - and usually a
police repeater is closer, although that is not certain either. If
there happens to be a ham repeater, there are not always hams there -
consider an accident that happens at 3.30 AM.. The fact that it is
quite uncommon to "happen" to pass by the scene at that hour is not
relevant.

Fortunately, our regulations state the proper procedure quite
explicitly. Not "permitted", but "required". And I figure that would
be a responsibility of ANY innocent bypasser.

1917. REQUEST FOR TEST EQUIPMENT MANUALS INFO

Newsgroup: rec.ham-radio
Date: 1990-10-11 13:49:36 UTC
From: jhk@SATURN.ACC.COM
Message-ID: <9010111349.AA09070@saturn.acc.com>
Source record: 7900

Subject: REQUEST FOR INFORMATION ON LAB TEST EQUIPMENT

I've been given some partially working lab test equipment that I would
like to use around the bench at home, but have no manuals which would
help a great deal in repair.

If you have manuals for one or more of these pieces of equipment, I'd
be more than happy to either pay for the copying at your location or
for the shipping to get them to here for copy and back to you.

Here is the list:

O'scope, Tektronix model 564B storage scope
with : 3A1 Dual Trace Amp Plug In
3B3 Time Base
3A7 Differential Comparator

O'scope, Hewlett-Packard model HP180D
with : 1805A 100 Mhz Dual Channel Vertical Amp
1824A Time base and Sweep Expander

EiP Autohet Counter, Model 351C
(has panel markings to go to 18 GHz, but someone has robbed
the first mixer and also the basic counter board, which can
probably be rebuilt)

Universal Counter, Hewlett-Packard HP5328A with Digital Voltmeter
and "Universal Module" (what a great name!)

Mail, email, phone or fax reply would be appreciated. I'd like to
get the stuff working again for ham radio use. Thanks.

|>
|>Larry Lippman @ Recognition Research Corp. "Have you hugged your cat today?"

Larry, I hope that I'm not getting the rep. as a real flamer and arguer
in these
here parts. But, predictably, I disagree. But, let's not take the
extreme case
that has been discussed of jumping on and calling a dispatcher. Let's
take this.

The big one hits the San Madrid fault and half of Southern IL falls in the
Mississippi. I'm home visiting, so I'm there and early on the scene.
The police
```

or EMS people see my radio and tell me to go stand on the other side of
this big
piece of concrete they're lifting and tell me if I see any casualties.
Now, the
law about type acceptance is not in part 97, so I have to say, sorry I can't do
that. The FCC wouldn't like it.

I think that clearly the FCC wasn't trying to say "Ok, all you Techs get to use the General CW band if it's a real big emergency." It states explicitly, "any means of radiocommunication at its disposal." And, to me that means any means. I think you can replace "any" with "all" or "each and every" and it's hard to respectably argue that they really mean "some" or "a few of the means at its disposal." They also contrast these communications with "normal communication systems." I hardly think that this simply means staying in your license restrictions. The wording makes it clear that they are talking about something much more drastic.

This argument is different than the one about calling the dispatcher. Although that is certainly controversial, I think this one is very clear. Please don't subvert the ability of responsible hams to contribute to emergency
communications.
Just take the rules for what they say and trust that I'll remember the
other part,
which states that the comms must be about "immediate safety of human
life... when
normal communication systems are not available."

1919. re:Alinco DR-590T

Newsgroup: rec.ham-radio
Date: 1990-10-11 14:07:26 UTC
From: szarekw@LONEX.RADC.AF.MIL
Message-ID: <9010111407.AA05490@lonex4.radc.af.mil>
Source record: 7820

In response to buzz here are my findings regarding the 590T

>I just picked up a brand new Alinco DR-590T and have had some problems that
>I would like to share with you all out there in ham-net land. Maybe someone
>out there can help me with a couple of these problems.

I guess not too many people have these rigs yet otherwise I would not have
to respond to your request. I hope there are others besides yourself that
are interested in this information. In any event this is what worked for
me (sans jinglish). I am not however responsible for what you do to your
rig . . . etc.

>1, I got this unit because of all the cool features it is supposed to have,
>including cross-band repeat. The instruction manual does not even mention
>this feature. After calling Alinco I found that this was a feature functions
>only after modification. They said (more than a week and a half ago) that they
>would send me the modification instructions. I haven't heard anything from
>them.

If you ask them (nicely) there are (a few) dudes at Alinco that are willing
to help and are smart enought to be helpfull (there is a differance ;-}).
They can fax you the information or even send it to you next day air at no
charge if you ask politely or are VERY persistant (as in my case).
Now the big news . . . to modify the rig to xmit out of band (to call the
cops etc ;-}), to operate as a cross band remote, etc. follow these easy
steps.
1) remove the control head from the unit (2 screws on each side of
the forward part of the rig, near the control head).

2) hold the control head in your hand face down and remove the two screws
you see on the back of the control head.

3) remove the cover from the back of the control head (it snaps off)

4) locate a blue loop of wire. There is only one blue loop of wire.

5) cut, unsolder, remove, destroy, nuke, the blue wire (your choice) [I
neither advocate nor encourage the indiscriminate use of nukes]

6) undo step 3

7) undo step 2

8) undo step 1

9) connect the rig to antennas, power etc as outlined in the manual.

10) hold down the function key and turn on the power

This is what you will find . . .
The rig now transmits everywhere.
it now will display (not receive) 800Mhz band and 300Mhz band on the 440
side of the display in rotation (press the uhf switch to switch from band
to band)
It will now display (not recieve) the aircraft band (yes it does indicate
AM) on the 2 meter side of the rig. There is no AM detector presently but
I am working on it.

Cross band operation:
To enable cross band remote press (and hold) the funciton key and then (while
still holding the function key) press the vhf switch. Cross band operation
is now enabled using the displayed TX and RX frequencies. Splits still funciton
in cross band operation so don't link 2 repeters together! Frequency selection
for each band can be from the vfo, memory, or ARM (a cool Alinco function).
To disable cross band operation simply press (and hold as before) the funciton
key and press the uhf switch. Note: failing to hold the f-key down and then
pressing uhf or vhf enables a strange function that I have yet to figure
out.

>2, The Autodialer (an option for the 590E according to page 13 of the manual)
>did not work as in the insturctions. Another call to Alinco and I found
>that it is also an option in the 590T. On page 19 it was pointed out to
>me is a note to this effect. These instructions are also unclear. Anyway
>I went out and purchased the required DTMF unit and installed it. Now I
>can store the numbers in the autodialer's memories, however I cannot get
>the rig to autodial any number except the number stored in memory #1. I
>have tried every possible interpretation of the directions on page 13 of
>the manual and had no success. Another call to Alinco . . . they told me
>that they knew that the manual was written in jinglish (japanese/english)
>and was hard to understand. They said that they would send me a complete
>manual written by someone who spoke english as their primary language. I
>asked them why this manual was not provided with the rig and they said that
>it was free to anyone who asked for it ?!?!

Simple problem . . . a typeing error (translation error?).
Turn to page 13 of the instructions
find "Transmitting the Stored Autodialer Number:(DR-590E: Option)

Step 2 should read:
Enter DTMF pad code c14 and select the desired autodialer channel.

>3, This rig is supposedly able to receive DTMF codes from another transmitter
>What will allow remote control of the rig (useful as a very flexible cross
>band repeater). I have not been able to get this to function on my rig at
>all. I can only hope that possibly the modification they promised to send
>me will enable this function or that the new english directions will beable
>to explain how to make this happen.

Even the grand Alinco wizzard has not figured this out. He said that he
was working on better directions and that as soon as he had them he would
send them to me.

>4, The remote page/DTMF squelch function are completely cryptic I hope they
>are also explained in the english directions.

Same deal as above. However if you sat around with a friend who also had
a similarly equipped rig you could probabily figure it out.

>Anyone with any mods or operation instructions for this rig please let me
>know. Am I the only one with these problems? Does anyone have any solutions?
>Is Alinco always this slow? etc.?

Here are your mods/instructions. Yes I believe you are. I found the solutions.
In my experience Alinco has always operated in this manner.

>I will post a summary when a solution is found
>so send responses to me at my address:szarekw@lonex.radc.af.mil

Here is the summary. In case you haven't figgured it out by now I am answering
my own query. I just figgured someone might want the info.

asking me for
|> extra money in almost the same breath as telling me they've decided
to hire 3
|> new people without consulting with me is a bit much.
...

Which is fairer, asking for optional contributions or raising the dues?
Personally,
I think ARRL has been doing a great job for the 33 years I've been a
member. (Guess
that makes me an OF, eh?) However, it takes money to do things, and
relying on dues
alone seems pretty regressive. There's a large range in "ability to
pay" among our
membership, so why not have special funds for special purposes?

I have my limits, though. I draw the line at ARRL Visa cards!

The information concerning special permits for foreign operators
was obtained from the London, Ontario regional office.

I have checked with the CRRL and they feel that the existing
recipricol agreement specifically between US and Canada has
not changed.

They also confirmed that the DOC is moving away from having
special permits so any requirement for US amateurs seems
almost impossible.

Since the RIC has not even been printed yet, it may be some
time before an actual policy statement can be viewed for
interpretation.

Unless officially announced in the meantime, I would say that
US amateurs shouldn't worrry too much about operating in
Canada.

By the way Lyndon, if you can get any more of those $5 UHF
radios, I'd be interested in about four (HI). We sure don't
get deals like that around here...

Radio Shack sells a TDR to it's repair centers from National Parts for less than $100. It's not a stand-alone, it's designed to plug into a scope, and you can actually SEE impedance changes in the COAX and approximate where the problems are.

If you don't want to buy one, KD5HM, Tom King, the designer, wrote it up as a construction article for QST about a year ago. It's a far cry cheaper than $1500!

>dispatch. It is also a hazard during major incidents, when only a
>handful of people NEED to be on the air (Triage, Command, Operations,
>Staging, etc. - not EVERYBODY).

I'm sorry the personnel in your area are so poorly trained that they cannot be depended on not to get on the radio unless they really need to. The solution to that problem is training, not prohibition. People get into just as much trouble during major incidents, and need to get help NOW just as much, as in the average house fire. An emergency worker should ALWAYS be able to call for help. I suggest you post your opinions on FireNet (the FidoNet fire/EMS echomail conference) about why the average emergency worker doesn't need communications. Put your bunker gear on first.

>Even the ones who have positions reuiring the use of an individual radio
>have no business utilizing a non-type-accepted ham rig as that radio!

...except in an emergency. Repeat after me: THE RULES GO OUT THE WINDOW IN AN EMERGENCY. Keep repeating until you understand it.

> He specifically stated that he was trying to use a non-amateur
>repeater. People who want CAP and MARS mods usually say so.

I hate to tell you this, David, but CAP and MARS repeaters aren't ham repeaters either. Why don't you ask, and then THINK, before you flame? Or is that too much to ask?

>> The original flame (from the same FidoNet newbie that I'm
>> responding to) was completely uncalled for.
> I disagree strongly. And I don't think 2 years in FidoNet and 7
>years in Public Safety communications plus 9 years as a licensed ham
>qualifies me as a "newbie."

OK, since we're citing qualifications, I've been on Usenet for 4 years, and operated FidoNet node #64 (before they even thought about regions/areas) for a couple of years, bailing out when IFNA got Machiavellian; I've been a ham for 19 years, and an EMT of one level or another for 9 years.

I'm reading (and writing) this on Usenet (via a gateway to an Internet mailing list. I've only seen you on here a couple of weeks, and haven't yet seen you write _anything_ yet that _wasn't_ inflammatory. Yup...you sure qualify as a newbie. The least you could do is not flame everything that comes along.

It sure was. I can think of several problems with the simplistic thinking above. First, not all areas of this country are blessed with 911 service yet. Second, as others have mentioned 911 if implemented would give you the dispatcher for the repeaters telephone exchange. Third, in our area we have a lid who likes to experiment with his touchtone pad. He never ids, rarely talks and never transmits long enough for us to DF him. If our patch were open, this jerk would be making funny phone calls to the county EOC. We have had to change all of our speed dial numbers from 3 to 4 digits since this *&@% figured out some of the 3 digit codes. Last, in my case I travel regulary from Harrisburg to Philadelphia and from Harrisburg to DC, there is no way I am going to remember all of the repeater access codes for these 2 hour trips.

If I can't raise anyone on 2 meters, I can always fall back on that <gasp> 27 MHZ CB set that I keep in the car for emergencies.

Regarding the equipment upgrade at W1AW:

>Just out of curiosity, how old was the gear they replaced? Was it
>rendered unsuitable because of parts unavailability?

The old gear was old when I started to work at W1AW (1972). There was a master exciter that generated SSB, CW or RTTY signals at a fixed frequency (3 MHz). This signal was then heterodyned with a series of crystal-controlled frequency converters to the the required signals for 160/80/40/20/15/10/6 meters. (The 2 meter rig was a conventional multiplier scheme modulated directly on phone, and tone modulation on CW.) All this was tube-type gear "homebrewed" in the ARRL lab.

The kilowatt amplifiers were "homebrewed" by Bill Orr W6SAI and friends at the Eimac ham radio club. Each used a 3-1000Z final with either either a 4CX-250 (20/15/10M) or pair of 6550's (80/40) for a driver.

I imagine this stuff was getting pretty "long in the tooth" after 30 years or so of continuous use.

>and code practice purposes. It's also a fact that the bulletin and code
>practice transmissions are conducted by paid operators for whom the ARRL
>had to get a special dispensation from the FCC.

The story behind this is fascinating. W1AW had been using paid operators since 1936 (and before that at W1MK) with no legal problems. The amateur regulations at that time had a prohibition against compensation for use of an amateur STATION, but no prohibition against payment for OPERATING.

Along about 1973 or 1974, the FCC changed the wording on some of the regulations in the iterest of "clarifying" them. Yes, you guessed it, the new rules made paid operators illegal. When the FCC realized what they had done, they issued a temporary permission for W1AW to stay on the air.

Then they added new rules allowing paid operators for certain types of amateur broadcasting. (Must transmit on all HF Amateur bands, must broadcast at least a certain number of hours per week, etc.) In effect, this part of the rules was written to legalize W1AW. I haven't checked since the latest rules re-write, but I think essentially the same language is still there.

The reason a larger antenna may make intermodulation problems worse has to do with the nonlinear nature of intermodulation. If, for example, the larger antenna increases the strength of all the signals at the receiver input by, say, 10 dB, the intermodulation products will increase in strength by at least 30 dB. This leads to the standard test for intermodulation: Insert a known attenuation between the antenna and receiver, and note how much the strength of the spurious signal changes. Intermodulation products will change by more than the value of the attenuator, while spurious transmitter signals will change by the attenuator value.

I'm SURE that this has been hashed out before, so my apologies. But...
my wife just got her tech ticket, and so I'm in the HT market again.

I've already got a Kenwood TH-25AT (which has since been replaced by
the TH-26AT I believe). It seems to work fine although once in a great
while (about once every three months) it loses it's memory.

Question: does anyone have a recommendation for an HT in the $300 range?
Does anyone recommend the TH-26AT? I'd like to get one that is
physically small like the TH-25AT.

Thanks.... John Kirby

Clayton,

I do a lot of work interfacing with law enforcement on 911 type calls.
And I can tell you for a fact that when a call comes in from a coin
phone the response of the dispatch centers in many cases is "Oh a coin
phone, oh well".

As a result of this I have told my family and friends that if they are
at pay phone they would be much better off dialing "0" and just
screaming for help. The operator will have the number you called from
and the law enforcement people seem to take these call more seriously.

This may sound strange but it seems to be the way it works.

I believe part of the problem is the high amount of prank called by
teenagers to 911 on coin telephones. It's not unusual to see someone
work their way from one end of town to the other dialing 911 on pay
phones.

Don't construe this as an excuse for the S.F.P.D. it's not. It's just
the way the system works.

Pete Lucas G6WBJ pointed out that a Toko helical filter (from DigiKey in the US) will do wonders to put the VHF overloading sources into the weeds, but that putting the 0.7 by 0.5 by 1.2 inch filter in a project box with connectors is more than a little clumsy.. Has anyone thought about making a big rubber duck or a mag mount whip with a filter integrated into the base??? Helluva neat product if it works. (Please send royalty checks to my callbook address hihi.)

I use a home-brewed 1/4-wave mag mount (based on a magnetic mike holder, a chassis-mount BNC and piano wire, from Hints & Kinks), and I suffer a bit of intermod with it on my IC-u2. Maybe I'll try it...

> ...difference... between my 'old generation' Yaesu and Icom HTs and my
> Kenwood TH 26. I attribute most of this to the extended frequency
> coverage of the Kenwood (138 to 174 MHz)... Anyone have similar
> experiences or maybe even hard data?

I have experienced intermods on certain ham frequencies with my Yaesu FT411, picking up paging frequencies around 164MHz. They did not use varactor tuning, instead a wide front end, and a high IF to partly compensate. Here are some details.

Measured sensitivity:

MHz uV
130 0.25
135 0.2
140 0.2
146 0.2
148 0.22
152 0.22
155 0.25
156 0.4
158 0.4
160 0.8
162.55 1.35
165 2.5
168 7
172 24
174 600

At 147.000: frequency 210 Hz low; deviation 4.2 KHz; tones deviation 3.2 KHz low, 3.3 KHz high (very uniform), but rather "hot" (normal is 2.2 KHz).

Based on 900718 call to the Yaesu 800 number:

The factory modification corrects an intermodulation problem. It changes the IF from 17.3 MHz (he confirmed that our measurement was correct) to 21.0 MHz. Why? The FT411 does not contain varactor tuning because "it's harder to fix, and apparently was cheaper to build it without that feature". (A quote from the guy I talked with: "They're designed and manufactured in Japan, we just sell them here.") Hence the FT411 has a wide RF front end, about 28 MHz, and a higher than usual IF, 17.3 MHz, to "push" image frequencies out of the front end band.

Unfortunately, the IF is just right for a repeater at 145.250 MHz to swamp 162.550, a common weather channel, through intermods. This was

the case in Indianapolis, where a powerful wide-area repeater interfered with receiving weather radio channel 1.

Searching my Colorado frequencies database for deltas of 17.3 MHz (plus or minus 5 KHz), I found surprisingly few conflicts...

1939. DAB taking ham freqs?

Newsgroup: rec.ham-radio
Date: 1990-10-11 22:28:58 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <9010112228.AA02460@cmr.ncsl.nist.gov>
Source record: 7890

Was I not tuned in, or has there been no mention of the FCC's proposals for accomodating digital audio broadcasting (DAB) ? The FCC has put forth three possible choices of frequency bands for DAB:

1) DAB somewhere in the 700 MHz region - taken from UHF TV (fat chance!).
2) DAB somewhere around 1700 MHz, taken from aircraft telemetering, with the telemetering moved to 2390-2450 MHz, this band taken from amateur radio.
3) Take the 2390-2450 MHz band from amateur radio and use it for DAB.

This would still leave the 2300-2310 MHz section of the ham band.

This brings me to the deeper question. WHY DO WE NEED ALL THAT MICROWAVE BANDWIDTH??

> My ham interests have mostly been in weak-signal, narrow-band operation. Clearly "my" type of operation doesn't need wide microwave bands, if narrower ones could be kept clear of slop-over from the neighbors.

I assume that ALL non-weak-signal microwave amateur communication will employ repeaters of some type, to get around the line-of-sight or big-antenna problems. As far as band-occupation is concerned, this is a BIG WIN - each QSO uses twice as much bandwidth (or time). (I don't think anyone can seriously fault the use of repeaters on these bands.)

> Assuming a vast increase in interest in digital communication, how much bandwidth is needed for it? What about the W6GN, et al, megabit data limks? Won't they be time-shared among a number of users? I think that the real question lies in how many "digital" hams there will be in any major metropolitan area, and how much information any given user is likely to want to transfer in the average minute. In computer terms, it seems unlikely that the user will "swap" with a central server. The only other BIG digital use that occurs to me is file transfer to/from servers. Today's fancy work-stations mostly get by with quite a few connected to single 10 Mbit/s ethernet - even though the boss would have to to pay big salary bucks if employees waited for files. The engineering-design folks now talk about 100 Mbit/s FDDI local nets; but they are also talking about huge descriptions of all the layers/materials in a complex VLSI circuit, or ship, or ....
I have no files (except VLSI chip designs) that are much over 1/4 megabyte. I think that it's going to be a long time (never?) before many hams deal with computer files as big as even a single layer of a VLSI design.

If you assume that each ham using a file server by radio transfers one quarter-megabyte file each minute, each ham averages about 35 kbit/s. (I don't really believe this much AVERAGE traffic, do you?) These are very one-sided transmissions because it doesn't take many bits to request a file.

```
-------------------------------------
Number of hams Resulting average
in an "Area" data transfer
-------------------------------------
2 70 kbit/s
20 700 kbit/s
200 7.0 Mbit/s
1000 35 Mbit/s
-------------------------------------
```

So 1,000 hams in a single geographical area, all simultaneously actively using file servers by radio, would occupy less bandwidth than the threatened part of the 2400 MHz band!! (And we have lots of other microwave bands.) Please, somebody, tell where I have gone wrong.
Remember, this must be entirely non-business-related traffic.

> The transmission of "human" images, like television (TV), has traditionally been an analog process. And it uses 6 MHz or so per picture, CONTINUOUSLY. A real "win" for band occupation. But compressed TV is already available. Quite good TV can be sent compressed to about 1 megabit per second, and it only gets a bit "jerky" at 300 kbit/s. But at least each TV signal occupies its channel nearly full-time, not bursty enough to allow time-sharing like digital data. TV will definitely need repeaters; doubling the occupied bandwidth. Since it takes two to QSO, a through-repeater contact still only uses one "TV-bandwidth" per participating station.

```
-------------------------------------------------------------
Number of TV hams Bandwidth using Bandwidth if TV signal
active in "Area" 6-MHz channels compressed to 1 Mbit/s
-------------------------------------------------------------
2 12 MHz 2 Mbit/s
20 120 MHz 20 Mbit/s
200 1.2 GHz 200 Mbit/s
1000 6 GHz 1 Gbit/s
-------------------------------------------------------------
```

So, even with a large increase in number of hams due to a no-code license, I conclude that the only ham application likely to NEED all our microwave bandwidth is the transmission of TV images.

```
-------------------------
```

I've been trying to stay out of the discussion, but my $0.02 worth:

If the situation is severe enough that I would gladly sacrifice my
license, pay a substantial fine, or {insert-favorite-punishment},
then, and only then, would I consider trying to use police/fire/whatever
frequencies if I were able.

I also strongly belive that if the situation were *that* serious, then
thems-who-are-in-power would choose not to prosecute.

My rigs are capable of reception out of band, but I've never bothered
to learn if they are capable of out-of-band transmit modifications.

I say "me too", because I have been on the air looking for DX for the last 3 years and have yet to hear anyone on the air from Uganda. I'm not sure if ham radio is not allowed there at the moment, or whether there are just very few licencees and they all keep quiet because of the hordes of US and other DXers that would descend on them. Or else I have just missed them.

So if anyone knows of any activity, please let me know too! (I'd prefer it on CW but phone will do...).

There is considerable activity from several neighboring countries - Kenya, Tanzania, Zaire and Rwanda all share a border with Uganda and have active hams. I'd guess, though, that it might be easier to enquire through the embassy and other routes.

To quantify the rarity of Uganda, it is #41 on the latest list of "most wanted countries" (in the radio sense) that I saw. Perhaps this is an omen, as I need 41 more countries, so statistically Uganda ought to be the next one I find...

I'm not being completely frivolous above, it really is very rare on the amateur bands, and I wouldn't be optimistic about finding any information this way. I would expect the U.S. embassy there to be in daily communciation with people here, on non-amateur bands (now I'll get flamed by people who tell me that in an emergency I can use any wavelength I want to - sigh...).

Tad sez:

The one that you use when you don't want ALI on the call! This is the
number that you use to call something into the city when you are in
the suburbs. In Seattle a couple of examples are 625-5011 and 583-2111.
It is switched through the network, rather than trunked. Because it

doesn't originate at the CO through a TSPS-like trunk, there is no ANI
or ALI.

Phil sez:
>
> It definitely sounds like there is a management problem there. Maybe you

Your reasoning was quite interesting. I tend to agree with your
conclusions. I just hope some nitwit with nothing better to do
doesn't decide to pester the FCC (or anybody else) for a ruling.

This is indeed different from jumping on any radio of your own accord and calling somebody. In this situation you have been directed to participate in the incident as a communicator.
You don't mention what frequency the person giving this order specifies. On ham frequencies, you would be restricted to those granted by your class of license. (See rules regarding RACES operation.) If you were directed to communicate via non-ham frequencies, nothing in Part 97 applies to the situation because you are being used as a citizen with a radio and not a ham operator.

Don't get me wrong. I agree with the concept. I was objecting
to the juxtaposition of the two announcements. My natural response
would be, "why don't you use the money you were going to spend on
these people's salaries, especially since the Board also authorizes
these new positions to hire their own support staff."

Oh, isn't this SO typical of the more obnoxious hamcritter on rec.ham-radio. First he DEMANDS that the ARRL board check with HIM before hiring anyone at HQ. Then when someone asks if he had actually proposed this to the league, or if he just got MAD first, he now claims that communication with his director is somehow beneath him....obviously if they aren't reading his mind they must be COMPLETE IDIOTS!

>
> This brings me to the deeper question. WHY DO WE NEED ALL THAT MICROWAVE
> BANDWIDTH??
>

AMSAT (worldwide AMSAT, not just AMSAT-NA) is planning to put a new satellite in this region which will occupy a Mhz of space. The problem with their proposed move is that we have satellites in the proposed spectrum NOW that admittedly don't occupy all of that but do occupy some of the frequencies. There is PACSAT, DOVE, and AO-13. The very life of AMSAT's proposed future projects, those we have funded and are doing engineering on, lie in the 2400-2410 region. If they leave that alone, they can have 2410-2450. Of course, what they REALLY want, is the lower ten Mhz to get away from the increased C/N they will have to have to get over and above Microwave ovens. AMSAT intends to go down flaming on this proposal. It is yet another nail in the coffin of any real advancement in amateur radio. The ever presnt pressure on our spectrum will be the end of the hobby for all who wish to do packet, satellites, Wide Band TV. We have 70cm threatened by Wind Shear radar (DAMN nature for making the natural wavelength of the vortices correspond to 70cm), L band threatened by land mobile, S band threatened by land mobile and DAB. The only reason our higher frequencies are not yet heavily threatened is that the devices for using them are still to expensive. I am VERY despondent by our outlook because of our seeming complacency, apathy, lack of monetary resources to do battle with these spectrum pigs, and lack of political clout in Congress. No matter how much I disagreed with Goldwater's politics, he DID defend amateur radio against all comers. We are sorely in need of a replacement. Bob, I think this answer was more than you requested or is it?

Message-ID: <1990Oct12.163813.13430@news.arc.nasa.gov>
Source record: 7922

John,

I have a TH-26AT and I am very much satisfied with it. It has performed mostly without a problem so far. Since you already have a TH-25AT, you could take advantage of the similarity between the two models for key accessories such as battery packs, speaker mikes and so forth. Because this was my first HT, I was a bit puzzled about intermod problems I experienced. There has been alot of discussion on this topic within the rec.ham-radio/info-hams net. The TH-26AT does have extended receive frequency range so there are broadband rf circuits. I think this intermod problem is symptomatic for these kinds of rigs regardless of manufacturer.

Good luck in your decision. I thoroughly enjoy my TH-26HT.

> It's amazing how little we seem to know about the services that operate
> around ours. When I saw the 6.46 Mhz split, the first thing that popped
> into my mind was CAP. I don't know of any other services that

I know quite a great deal about services other than amateur
radio. I admit to not thinking of CAP, but the person who made the
original inquiry did not, in his first or any subsequent message,
state that he had any legitimate use for the mod. If he is a CAP
member, why not say so?

Because this is not the CAP split... it is (among other things) the
Radio Common Carier (RCC) split, to wit:

The key is not average per minute, over time. It's average during the
time that you're willing to wait for a response. In batch mode,
next-day results, you can average over a day. Interactive applications
require averaging over milliseconds or seconds.

>If you assume that each ham using a file server by radio transfers one
>quarter-megabyte file each minute, each ham averages about 35 kbit/s.
>(I don't really believe this much AVERAGE traffic, do you?) These are very
>one-sided transmissions because it doesn't take many bits to request a file.

>using file servers by radio, would occupy less bandwidth than the threatened
>part of the 2400 MHz band!! (And we have lots of other microwave bands.)
>Please, somebody, tell where I have gone wrong.
>Remember, this must be entirely non-business-related traffic.

Okay, you've gone WAY wrong.

First off, you have to translate the digital to analog (bandwidth)
domain. The ratio is a cost tradeoff. Fairly cheap (FSK, 2PSK) radios will
give you about 1 Hz/bps or worse; the absolute worst possible results,
of course, are obtained by acting like 2 meter TNC users. But higher

efficiency costs a bit more; 6 bps/Hz is possible, but you have to be the phone company to afford it.

Second, what is the latency we're tolerating? We do a lot more than transfer files with our computers, and would like packet radio to be like that. NNTP (news protocol that we're using now) polls each article from the server to the reader when you ask for the "next" one. How long do you want to wait? At 1 Mbps, it's pretty good. At 1200 bps, it's hopeless.

Should I even begin to mention remote graphics like the X Window System, which require interactive speeds in the 64 kbps range to be useful? It's not the average over the day, but the latency per message, that counts.

Also, a 10 MHz band is too small for repeaters. If we had two 10 MHz segments about 80 MHz apart, it would be a lot easier to separate the input from the output, in the 13 cm. range.

> The transmission of "human" images, like television (TV), has traditionally
>been an analog process. And it uses 6 MHz or so per picture, CONTINUOUSLY.
>A real "win" for band occupation. But compressed TV is already available.
>Quite good TV can be sent compressed to about 1 megabit per second, and it
>only gets a bit "jerky" at 300 kbit/s.

That's not exactly true either. If you're talking about "teleconference" video, the "talking heads" application, then you're right; for maybe $20-30k, you can compress down to 256 kbps and be only a little jerky. (That's hardly an ATV price range.) But "full motion" video, equivalent to a 6 Mbps analog channel, takes about 45 Mbps with minimal compression and probably several Mbps if compressed optimally. That's when you have real moving pictures, like the broadcasters use, and not just faces against a backdrop. Try watching a western through a compressor...

Clearly the 2300 MHz band is a ripe target for plucking. Few hams use it. But that doesn't mean we should be happy with microwave sliver bands.

There seem to be a number of misconceptions regarding what will
happen during the SAREX operations, though Patty (winter@Apple.COM)
clarified a number of things very well.

First, not all of Ron's downlink time has been allocated. He will have
time to talk with whoever he happens to hear. Look at the schedule I
posted back in September, anytime during the "crew tended" portion of
the SAREX schedule that is not between LOS and AOS of a specific
ground station is free time. For example, between MET 1/10:31 and
MET 1/12:00 Ron has no scheduled contacts.
If you didn't get a copy of the schedule I posted, send me mail at
gmorris@nasamail.nasa.gov and I'll mail it to you. The fact is there
just isn't a whole lot of free time while Ron is within sight of the
U.S. He only has a hour or two at the beginning and end of his shift
that is available for SAREX ops. Then you take out scheduled time
and time where he is not in range of the U.S. and there isn't a whole
lot of time left. I haven't taken the time to analyze the schedule
to find the free time where he is over the U.S., yet.

Patty correctly described the bridge contacts, Ron will talk to
amateur ground stations via his 2M radio, the ground stations will
use phone patch to a amateur repeater near the school and the school
will have a amateur radio set talking to the repeater. On the time-
line I posted these are the contacts with VK6IU, VK2AS and PY2PJO
and others.

Someone mentioned that Ron Parise was on the day shift, that is not
correct. Ron is on the team that has to stay in the "bright room"
at night for 4 days before launch to timeshift their circadian
rhythm (bright it is, 30,000 lux).

As far as QRM is concerned, scheduled QSOs are not on the announced
frequencies, so there shouldn't be a problem there. Plus most of
the school QSOs occur over Australia and Brazil.

You're right, it sounds awful. (etc)

David

What do you mean, awful? I've had some great CW dreams - in one, I was in Benin (TY) listening to a CW pile-up, it was pretty neat. One of my better dreams.

The really awful dreams are those where you are in an SSB pile-up, shouting and shouting and shouting and not getting through the pile-up. I hate it when that happens.

> From: jmaynard@THESIS1.HSCH.UTEXAS.EDU (Jay Maynard)
>
> I'm sorry the personnel in your area are so poorly trained that they cannot
> be depended on not to get on the radio unless they really need to. The solution
> to that problem is training, not prohibition. People get into

Yes, I agree, there is a training problem. There is also a big
attitude problem (spelled P-O-L-I-T-I-C-S) about "making" vollies take
any kind of training.

> help. I suggest you post your opinions on FireNet (the FidoNet fire/EMS
> echomail conference) about why the average emergency worker doesn't need
> communications. Put your bunker gear on first.

I never said they didn't need EMERGENCY communications. I said
they don't need modified ham radios for routine operations and daily
"radio checks." If they were properly equipped with legal radios for
their day-to-day ops, then they would have legal commercial radios
during emergencies, too, wouldn't they?

> >Even the ones who have positions reuiring the use of an individual radio
> >have no business utilizing a non-type-accepted ham rig as that radio!
>
> ...except in an emergency. Repeat after me: THE RULES GO OUT THE
> WINDOW IN AN EMERGENCY. Keep repeating until you understand it.

OK, Jay, if you will keep reading my messages until YOU
understand them. I was not referring to emergency communications.
These EMS officers/firefighters/whatevers DO NOT NEED AMATEUR RADIOS
FOR THEIR DAILY AGENCY OPERATIONS.

> > He specifically stated that he was trying to use a non-amateur
> >repeater. People who want CAP and MARS mods usually say so.
>
> I hate to tell you this, David, but CAP and MARS repeaters aren't ham repeaters
> either. Why don't you ask, and then THINK, before you flame? Or is that too
> much to ask?

But ham licensees can be members of either organization BECAUSE
they are ham licensees. This is not likely with Public Safety
organizations, businesses or other "non-amateur" radio services.

> > I disagree strongly. And I don't think 2 years in FidoNet and 7

> write _anything_ yet that _wasn't_ inflammatory. Yup...you sure qualify as a
> newbie. The least you could do is not flame everything that comes along.

Only inflammatory to people who believe in their inalienable
right as a ham operator to transmit on any frequency to which they
think they ought to be entitled by perceived loopholes in the rules.
It just ain't so.

> Telecom-Digest today:

They aren't kidding about the prank calls. In the dispatch
center where I worked (Rochester, NY) calling from a pay phone was one
of the criteria for reducing a fire assignment due to the high
probability of being a false call.
It isn't just the dispatchers that react that way. Listen to a
police officer's tone of voice when the dispatcher informs them that
the call they are on originated from a pay phone.

It does seem to be the logical candidate among the KNOWN modes.
Or how about spread spectrum? Are there any calculations available on
how many hams using spread spectrum technology could occupy xxx MHz?
It seems strange that FCC may be considering reallocation of
spectrum for another wideband mode when their emphasis lately has been
on increasing spectrum efficiency through better narrowband
technology.

> irrelevant in a bona-fide emergency. Yes?

Yes! This is the reasonable viewpoint. Owning and modifying
radio equipment for out-of-band operation is not IN ITSELF illegal.
Contrary to the apparent tone of some of my earlier messages in this
thread, I am not against the mods, but rather the frivolous USE of the
modified radio.
If people would just keep in mind that they could be held
accountable for their actions (whatta concept), maybe there wouldn't
be so much anguish and irritation over illegal use of radio gear. The
use does occur, so obviously the users are not using their heads.

> Alan, N0MFW (owns a potentially illegal HT)

Lots of things are potentially illegal. Whether your HT
actually becomes illegal is up to how you choose to operate it.

Maybe we can convince the FCC to redefine "crossbanding" or at
least reduce the restrictions on its use.

1971. A Non CW Antenna?

Newsgroup: rec.ham-radio
Date: 1990-10-13 04:19:53 UTC
From: julian@bongo.UUCP
Message-ID: <264@bongo.UUCP>
Source record: 7921

Earlier in the week I was lurking in a parking lot in a seedier part of North Hollywood. I noticed a car with what appeared to be a base loaded HF antenna. So I crept up for a look. Yup, nicely built base loaded job - far too snazzy to attach to my chariot. I took a closer look, it had a label with a brand name. The antenna was called "The Modulator"

Now isn't that amazing seems that all that work people have done with microphones, audio filters etc has been wasted. The key to decent modulation is in the antenna. It said so right there on the label. But this does leave an important question:

Could this antenna be used for CW? We all know that CW stands for Continuous Wave, which is unmodulated carrier. How about that, a no-code antenna. Think I'll get one of them things even if it will outclass my car.

We now return you to "If I'm dead can I call the cops on my radio?"

1972. Re: Loss of 2400 MHz (85 lines)

Newsgroup: rec.ham-radio
Date: 1990-10-13 04:32:18 UTC
From: rc@cmr.ncsl.nist.gov
Message-ID: <9010130432.AA07521@cmr.ncsl.nist.gov>
Source record: 7638

Fred R. Goldstein and Bob McGwier responded to my deliberately inciting
posting where I ask: "WHY DO WE NEED ALL THAT MICROWAVE BANDWIDTH??"
--- Comments on Bob's posting -------
Thanks for your comments - though they are fully as despondent as my own
feelings about keeping the microwave bands. As you point out, AMSAT is only
likely to be able to show need for a few MHz, not many times more than the
EME and terrestrial weak signal crowds would like (per band).

--- comments on Fred's posting ----
I calculate some AVERAGE channel capacities needed by 2 to 1000 hams doing
a lot of large file transfers.
Fred calls me to task, saying:
> Interactive applications require averaging over milliseconds or seconds.
My response: Just because I average over a minute, doesn't mean that the
traffic statistics will cause you to wait a minute. I could have averaged
over a second, and come up with about the same results with more than a few
stations. ie: 28 stations using 35 kbit/s each is about 1 Mbit/s

Regarding occupied bandwidth, Fred says:
> Okay, you've gone WAY wrong.
> First off, you have to translate the digital to analog (bandwidth)
>domain. The ratio is a cost tradeoff. Fairly cheap (FSK, 2PSK) radios will
>give you about 1 Hz/bps or worse;
I say: that is the number I implied...
> But higher efficiency costs a bit more; 6 bps/Hz is possible,
> but you have to be the phone company to afford it.
I say: .. and have a good S/N ratio... HEY FRED, I was trying to say we
NEED the bandwidth, not that we need even less.

> Second, what is the latency we're tolerating? We do a lot more than
> transfer files with our computers, and would like packet radio to be
> like that. NNTP (news protocol that we're using now) polls each
> article from the server to the reader when you ask for the "next" one.
> How long do you want to wait? At 1 Mbps, it's pretty good. At 1200
> bps, it's hopeless.
I say: Don't you have computing power locally? Can't you transfer the mail
in bulk and read the individual messages locally? Anyhow, just 'cause I
averaged over a minute doesn't say you'll wait a minute. How long does it
take you to read a 4 kilobyte mail message? Can't the mail system someday be
smart enough to transfer one message ahead, or even all new messages? With
personal computing power at home, we shouldn't demand to be allowed to remain
stuck in the past with a mainframe-does-everything attitude.

> Should I even begin to mention remote graphics like the X Window System,
> which require interactive speeds in the 64 kbps range to be useful?

> It's not the average over the day, but the latency per message, that
> counts.
I say: Again, don't you have local computing power? Anyhow, it generally takes a while to interpret a screen before you want the next one. Since I gave you 35 kbits/s of a 1 Mbit/s (say) channel, we don't seem to widely disagree on this one.

> Also, a 10 MHz band is too small for repeaters. If we had two 10 MHz
> segments about 80 MHz apart, it would be a lot easier to separate the
> input from the output, in the 13 cm. range.
I say: Easier, yes, but 10 MHz spacing would just be the 600 kHz of 2 meters scaled to 13 cm. With 1 MHz bandwidth repeaters, something like 15 to 20 MHz separation might be a better scale-up - though antenna directivities are a LOT better on 13 cm for a given physical size.

I then talked about how much bandwidth TV (raw analog or 1 Mbit/s compressed) takes, the idea being to show that TV is a bandwidth hog (either way) which is what is NEEDED to actually fill up the bands. Regarding compression, Fred says:
> That's not exactly true either. If you're talking about
> "teleconference" video, the "talking heads" application, then you're
> right; for maybe $20-30k, you can compress down to 256 kbps and be only
> a little jerky. (That's hardly an ATV price range.) But "full motion"
I say: Why do hams need more that "talking heads" ;-(Also, today's price won't protect bands tomorrow.
> But "full motion"
> video, equivalent to a 6 Mbps analog channel, takes about 45 Mbps with
> That's when you have real moving pictures, like the broadcasters use,
> and not just faces against a backdrop. Try watching a western through a
I say: ABC news has been using compression to
get two TV pictures into 45 Mbit/s (T3) between NYC and DC for a number of years. Do you complain about their picture quality?

> Clearly the 2300 MHz band is a ripe target for plucking. Few hams
> use it. But that doesn't mean we should be happy with microwave sliver
> bands.
I say: My posting was intended to demonstrate HOW we have at least SOME chance of fully occupying the microwave bands with a plausible number of hams. It's not packet text, not file transfers, not weak-signal CW, not X-windows, it's TV, TV. Everything else will "fit in the cracks".
Am I on amateur TV? Well, no ......

>
>I don't understand ... why? Just because the outside antenna can "hear"
>better?

The outside antenna will collect more signal than the rubber duck.
When you over drive an amplifier you get spurious products. As an example,
think of an HF linear designed to be driven with 65 watts. Drive it with
400 watts and you will be very unpopular. Can you say splatter? The situation
is the same in a receiver RF amplifier, only the levels are much lower.
When you hit it with too much RF you change the operating point of the
amplifier to a nonlinear portion of it's operating curve. Another name for
a nonlinear amplifier is a mixer. One way to reduce this problem is to design
the amplifier with a large standing current. This strong dc bias requires
much more input signal to shift the operating point to the nonlinear
region. HT manufacturers don't do this because of excessive battery
drain. They don't put in good passive filtering because hams have demanded
wide receive coverage and a very small package. It's a tradeoff, if you
want a clean receiver you must accept a bigger package with narrow
frequency coverage and heavier battery drain.

>
>This brings me to the deeper question. WHY DO WE NEED ALL THAT MICROWAVE
>BANDWIDTH??
>

The numbers in your article didn't allow any guard band. Assuming reasonably state of the art equipment, doubling your numbers should allow acceptable guard band.

Considering your 35 kbs assumption, I certainly want better thruput than that. Floppy speed of 500 kbs would be acceptable now, but I do want to be able to interact with a X client/server pair in a snappy manner. I do want to be able to program distributed computer systems. I do want to transmit high definition video in real time. I want to do things that are currently impractical because we don't have the speed/bandwidth needed yet. Predicating future spectrum needs on current digital usage is a mistake. There are many potential digital uses that currently aren't being done because the technology to give us the needed thruput isn't available to amateurs yet.

As one example consider an autonomous mobile robot. It transmits high definition video of it's surroundings. It's movements are controlled by a set of cooperating subprograms running on a group of desktop computers all connected by a distributed network. Sounds fantastic doesn't it? Give me the thruput and I know several people who would like to take a crack at it. The lower microwave bands are ideal for this application since conventional omni antennas are still practical. At 10Ghz and above tracking problems would become severe at fairly short ranges.

As another example consider amateur radar. The doppler radar I play with doesn't take up much bandwidth, but a friend of mine is playing with pulse radar for radiolocation. Yes, it's not at 2 Ghz, but it still takes up a big chunk of amateur microwave spectrum.

There's lots more than weak signal work being done at microwave frequencies. Not a lot of people are doing it yet, but as more people learn how to do it, the activity will hopefully grow. If we lose large chunks of spectrum, it'll die on the vine. The few remaining slivers will only be useful to the weak signal DXers and some great experimental work will be lost.

>
> Tim - KC6GNJ

Please ask him under what authority he is doing so. The reason for type acceptance is to preclude the need for technical inspection of individual pieces of gear. Guess what every piece of "modified" ham gear must go through before it may be used on CAP frequencies? Right -- inspection by a commercial licensee to ensure emmission and stability performance.

Each amateur licensee is granted the authority to certify his own gear when used in amateur use. That is why home-brew amateur gear is legal. That's also why there is a technical exam.

The certification remains with commercial licensees for non-amateur use. This certification overides type-acceptance.

Unless your FCC friend can provide other documentation, that is.

This is my signature. It doesn't contain my name at all!

Hi all,

a friend of mine asked me to forward his mail to this group:

------------------ cut here --------------------------

Hi all,

I soon will be a radio amateur. I own an Atari Mega-ST 2 and so I am
looking for all kinds of soft and hardware referring to ham radio.

Especially I am looking for wefax-software, packet radio programs,
CW-decoders (Hard AND Software).

Perhaps somebody could give a hint to me and tell me where to get such
things !!

Thanks very much.

Write either to: 100012.1123@compuserve.com or
fendrich@salyko.doit.sub.org

Thanks again!

Did anyone see the CBS report on the usage and missuse of low power RF devices. This segment was aired October 12 in the late night spot. I was much disturbed by the view put forth by CBS that people who use scanners are doing something unethical and that the radio spectrum should be opened up to commercial interests. The person CBS invited to give the opposition position (i.e. that it is ok to listen to short wave radio and other frequencies) was not given much opportunity to talk. I will be writing CBS to express my views and I hope that many others will write them

> any kind of training.

Just because someone's not paid to do a job doesn't mean they can't do it in a professional manner. My 9 years in EMS were entirely volunteer, yet I received as much training as any paid paramedic in Texas (about 900 hours, between the various levels of EMT training and American Heart Association Advanced Cardiac Life Support certification). If they don't want to get trained, they shouldn't be out there.

> I never said they didn't need EMERGENCY communications. I said
> they don't need modified ham radios for routine operations and daily
> "radio checks." If they were properly equipped with legal radios for
> their day-to-day ops, then they would have legal commercial radios
> during emergencies, too, wouldn't they?

You must have been reading a different discussion than the rest of us. We were talking about use of modified ham rigs in emergencies. It's apparent you don't even bother reading before flaming.
Nobody was defending use of ham rigs during routine ops. Just EMERGENCIES.

> OK, Jay, if you will keep reading my messages until YOU
> understand them. I was not referring to emergency communications.
> These EMS officers/firefighters/whatevers DO NOT NEED AMATEUR RADIOS
> FOR THEIR DAILY AGENCY OPERATIONS.

Well, ** EXCUUUUUSE ME!!! * We were talking about EMERGENCIES. Period. The EMS officers need radios during routine ops, but that's a separate issue from using ham rigs during EMERGENCIES. Have you figured it out yet?

> Only inflammatory to people who believe in their inalienable
> right as a ham operator to transmit on any frequency to which they
> think they ought to be entitled by perceived loopholes in the rules.
> It just ain't so.

(I liked the way you deleted my qualifications and left yours...)
In an emergency they DO have such a right. IN AN EMERGENCY, THE RULES GO OUT THE WINDOW. Keep repeating it, since it obviously hasn't sunk in yet.

1979. Re: CBS "Goodnight America Show"

Newsgroup: rec.ham-radio
Date: 1990-10-13 21:48:57 UTC
From: judice@sulaco.enet.dec.com
Message-ID: <9010132148.AA22948@decpa.pa.dec.com>
Source record: 7637

Yes, I also saw that show and was pretty horrified. The segment before the swl-er, had CBS's "science consultant" - his name escapes me, but he's the former host of the PBS Newton's Apple show discussing frequency congestion. Lots of talk about navy radar "jamming burglar alarms in San Diego" (I thought it was garage door openers?).

All of this was presented at about a 3rd grade level, by a pair of co-anchors who later demostrated their techo-prowess by explaining "smileys" (:-), ;-), etc.).

What an awful show, and as the previous poster mentioned, very unresponsible. I would not worry though - I doubt many people were listening to this drivel, and you can bet the show will be cancelled in short order...

1980. DX Computer Logging programs???

Newsgroup: rec.ham-radio
Date: 1990-10-13 23:29:11 UTC
From: phil@hansen.Berkeley.EDU
Message-ID: <2042@lupine.NCD.COM>
Source record: 7640

I am looking for any and all companies that make computer logging programs.
Specifically I am looking for the following:
- Computer control / Data acquisition from a Kenwood HF Radio
- Awards tracking (WAZ, WAS, DXCC, etc)
- QSL label making / tracking
- Terminal emulator for packet
- Terminal emulator for HF TNC (RTTY, ARQ, etc)
(At the same time as packet).

If you know of something that does even some of these things please
let me know. I am using a PC/AT compatible computer so programs for this
type of computer is needed.

I have heard of a program called DX LOG, but I do not have the address
or phone number for the company that makes/markets this.

Thanks in advance!

Hi Dan,

I've recently taken up skydiving, and I use a Yaesu FT-703 with a vox
switch to chat to the people on the ground (I'm still trying to find
a fellow ham to have a two-way conversation with).

As you say, operating while in freefall is not on. (I'm there yelling
"look - reach - pull!" to myself, and *I* can't hear it! In any case, the
boom mike gets blown up to my forehead. The first time I did this, I thought
that the mike had been ripped off completely! :-)

Anyway, under canopy, it works fine. The only problem is that the Yeasu vox
switch enable is on the back of the rig, and so it's hard to get at when
you're crouched in the back of a tiny plane. I usually use it clipped to my
belt, with the carry strap wrapped around the belt-loops on my jeans.
At least, I haven't lost a rig yet :-)

One thing to consider: I presume you want your TCO to give you instructions
to reach the target - he would have to be a licensed ham too. As far as
I know (in Australia at least), there are frequency allocations specifically
for parachuting activities. maybe your national parachuting federation
could advise you here.

The receiver in a hand held radio generally has a few corners cut in the
design to that they can fit it into that sexy little package. The front
end is designed to work with the rubber duck antenna that comes with it.
Hooking the radio to a larger outside antenna (or even an AEA Hotrod)
in urban areas can often deliver strong off-frequency signals to the
front end that effectively "swamp" it.

I understand that the ARRL does not do any lobbying because it would
threaten the league's tax exempt status.

1984. HTs

Newsgroup: rec.ham-radio
Date: 1990-10-14 02:39:36 UTC
From: sehrlich@lynx.northeastern.edu
Message-ID: <memo.485893@lynx.northeastern.edu>
Source record: 7644

I have a couple of questions.

1) I've been reading many of the messages posted here about intermodulation on 2m HT due to wide band reception capabilities. I was wondering if it would be possible to just add in a resistor or two somewhere in the circuit board to cut down on the wide-band reception? Would this aid in less intermodulation in the HT?

2) I live in Boston, MA, and have been told that there is not much 70cm activity in these parts, but that 2m is very active. I was wondering if 70cm is active in other parts of the country - namely anywhere not on the East coast (or near the East coast)?

Now that I have passed my Technician exam am waiting for my license to come from the FCC (and am busy at studying for my General now), although I am very tight on money, if I were able to squeeze out a few dollars for a used HT at a flea market or somewhere, wshould I invest in dual band HT, or just go for the 2m HT?

Thanks for any help.

73s,

Scott

You're missing the point. Why not force the officials to
provide ham operators (who are usually citizens, voters and taxpayers)
with the same grade of service that all other emergency callers get?
Insist on having them do it the SAME way for EVERYBODY. It's their PR
problem, not ours.

I would call your average flaming response to everyone pretty
obnoxious. Read the article again and this time, THINK about it.
The point is, the ARRL Board of Directors advertises quite
freely how "accountable" they are to the members. The official ARRL
line is that the League is not run by the people in Newington, but by
the members. If that is the case, then the members who are actually
running the League should be deciding on major expenditures of OUR
dues money.

>
> Politics? You mean like political lines between cities are just
> some annoying inneficient POLITICAL problem?

Once again, you are not replying to what I actually said.
There is a difference (on paper) between a dispatch center and a
PSAP. Some communities, like yours, actually have their PSAPs
physically separated from the dispatch centers. Other communities,
like mine, have a single PSAP/dispatch center in one location. My
local OEC dispatches for all of the communities in Monroe County
except a handful who have their own police dispatch but still get
their calls through our 9-1-1 PSAP. To the extent that they prevent
the citizens from getting efficient, effective 9-1-1 service, YES
those political lines are just a politica problem. There is no other
valid reason for depriving the community of a good emergency Public
Safety emergency communications system.

> In Seattle, we have a number of surrounding suburban towns. Why
> in the world would these separate municipalities route all of their
> 911 calls through one central PSAP, when they can use selective
> routing to put the calls automatically into the jurisdiction that
> serves the caller?

They would if all dispatching originated from one unified
center. With Enhanced 9-1-1, it really does not matter where the
caller is or where the PSAP is. The ANI/ALI takes care of the
caller's location and the dispatch center selects the agency. I
should point out that I don't think my local OEC is the best-designed
place. The PSAP should really be in separate redundant locations and
the dispatch facility should be more secure.

> were talking about use of modified ham rigs in emergencies. It's apparent
> you don't even bother reading before flaming.
> Nobody was defending use of ham rigs during routine ops. Just
> EMERGENCIES.

Sorry, but equipping people who have some legitimate business
on Public Safety channels with legal radios completely eliminates the
need for modified amateur equipment AT ANY TIME.

> The EMS officers need radios during routine ops, but that's a separate
> issue from using ham rigs during EMERGENCIES. Have you figured
> it out yet?

It's the same issue in my community. Ham radios are cheaper
and easily modified. What do you say to the PS "professional" who
decides it would be better to talk on the 2 meter freqs on his
modified portable, but who does not happen to possess a ham license?
That is also the same issue.
My point, and my OPINION, is that nobody NEEDS a modified ham
rig to use on non-amateur frequencies. Licensed hams don't need them.
It doesn't matter if they belong to the rescue squad; they should be
using equipment that was type accepted for Part 90 service.

Agency members who are not licensed hams have no legitimate use
for any amateur equipment - period.

> In an emergency they DO have such a right. IN AN EMERGENCY, THE RULES GO
> OUT THE WINDOW. Keep repeating it, since it obviously hasn't
> sunk in yet.

I can't repeat a lie. The rules don't go out the window,
because there are rules governing emergency communications. The
attitude that the rules can be broken whenever the operator feels it
is justified has got to go out the window.
The justification for the amateur radio service as an emergency
communications resource for the community was never based on our
ability to make our radios transmit on police frequencies. ARES and
RACES do not build their disaster plans on hams using non-amateur
frequencies during disaster operations. Hams are authorized to
provide a unique and valuable emergency service, but only WITHIN THE
FREQUENCY BANDS ALLOCATED FOR HAM USE.

Jay, we probably aren't ever going to see eye to eye on this
issue. We may not even agree (ref your comments above) that we are
even having the same conversation. Let's not clutter up the
echo/newsgroup with our argument. I have stated my position and you
have stated yours. Let's acknowledge each other's right to our
respective opinions and interpretations and leave it at that. 73.

1991. "Shop" version of MT-1000 ??

Newsgroup: rec.ham-radio
Date: 1990-10-14 10:57:00 UTC
From: RHAREL%FAB8@SC.INTEL.COM
Message-ID: <9010141058.AA02548@ucsd.edu>
Source record: 7651

Is it true that a module is available for the Motorola MT-1000 which
will allow Keyboard entry of frequencies without the aid of a RIB or
PC ? I was told this version is called the "Service shop MT-1000" or
something of sorts. I would appreciate any further information from
readers who have the inside word.
Tnx,
Rich

Actually the extra attenuation might be a "good thing". The basic problem
is after all front end overload. As you say, a minimum insertion loss
cavity would be about 10" in diameter and 3' tall.

> be capable of RCC splits with amateur transceivers?
>

1. And how do you know it is an RCC split the requestor wanted? You know for sure that that split is used exclusively for RCC, and not by something else as well? There is a whole world of communications, and a whole world of splits. DO you know of a 765 kHz split? I do. So, we still have no proof of what the original requestor wanted the split for.

2. Last time I checked, there was no regulation about not using strange splits for oddball use in the ham bands. Please post chapter and verse if there is.

3. I don't think hams need out-of-band capability. However, being a ham is not exclusive with being an EMT, Firefighter, MARS, or CAP. Neither is being a ham mandatory for any of those. So, it is feasible for those hams who are involved in other activities to use the out-of-band capabiities of the equipment they already own, provided it is certified properly.

4. There is one real good reason to use modified ham gear when possible. It is cheaper. Who generally pays for modified ham gear? The user. Who pays for the Motorola gear? The taxpayer. Which gear will the user take better care of? Which one does he have a financial stake in? Are the taxpayers better served by buying a lot of commercial HT's and forbidding use of ham gear, or by outfitting another rescue unit and letting the volunteer members of the squad use ham gear?

5. When you get down to it, nobody needs anything. People were able to live quite happily before radio was invented. Same with electricity. Airplanes. Cars. The Wheel. However, they were invented, and people live (maybe) better than before. The point is, ownership of a radio capable of transmitting RCC splits, at RCC frequencies, is NOT illegal. It is not illegal to own a radio capable of transmitting at the local police frequency. It is not even illegal for a non-ham to own ham transmitters.

This is my signature. It doesn't contain my name at all!

> - Terminal emulator for packet
> - Terminal emulator for HF TNC (RTTY, ARQ, etc)
> (At the same time as packet).

Phil,

You're looking for a lot in the same package. Here are some I know of:

DXLOG - PAYL Software (see ads in National Contest Journal). It tracks DXCC,
WAZ and Oblasts. It has QSL labels. It doesn't do packet, yet, but is
planned for a release soon.

EASY-DX - MFJ - this package has a TNC interface for working with the
PacketCluster(tm) software, and same features as above.

These are the two I'm most familiar with. I'm using DXLOG. Both can import
data from CT (K1EA contest logger). Some other packages I've heard of:

N6RJ logger (hr Bookstore)
KD7P logger
Master Log (dunno who's this is)
WB2DND
several others.

I'm not aware of the strengths and weaknesses of all these programs. I
couldn't find too much info in the latest NCJ on anything but DXLOG.

Hope this helps.

Part of it is historical, viz., in the early post-WW2 days precision frequency control and stability in the microwave region were unknown. Big, big bands were allocated in the sometimes forlorn hope that with that big a target, we'd manage to land somewhere inside of it.

> {NENA: National Emergency Number Association }
> {APCO: Association of Police Communications Officers}

Well, I am not up on these sort of things. I guess I just assumed too much.
We have a centralized dispatching system here, but I guess we smaller
communities can do this sort of thing a lot easier than the big cities.

> Tad sez:
>
> The one that you use when you don't want ALI on the call! This is the

I guess they just get a call and a blank screen or a message that indicates
it is a non-ALI call. But do they give out these numbers easily?

> If the obvious network solution is to program in the 7 digit equivalent to
> eliminate ANI/ALI, why piss people off by insisting on doing it YOUR way?

It does not need to be a ham radio issue. There are plenty of examples of
need for certain numbers to be properly identified to a dispatcher. You
do NOT want an ambulance to run to your repeater site when someone is
bleeding to death on the interstate 20 miles away.

Show me an administrator who would not agree with the fact that certain
phone numbers need to tell the dispatcher about the special circumstances
and I'll show you an administrator that DESERVES to have done to him,
things that would get an ordinary person pissed off, and I'll show you
an administrator that DESERVES to become unemployed.

An emergency dispatching system is NO PLACE for political squabbles.
They should do the job or get someone who will.

> Hmmmmm. . . . makes me wonder. How come the rule still reads like
> this if there is no longer a sending test?

Because there actually still is a sending test. It's just that the VE's
have the option to not include it. The FCC will accept a receiving test
as proof sending ability, but the VE doesn't have to do it that way.

It is possible to have a central dispatching point, and the suburban communities can choose to participate or not. Their 911 calls can be directly routed to them otherwise. Then I guess you will need to program your 911 code to call the non-ALI number of the central dispatching point if you happen to be sited in one of these unfortunate communities.

> radio room, no problem with deed restrictions!

What a silly restriction. I wonder about the person who wrote that in
the first place. Perhaps they tried to rule out transmitting antenna?

But there are some cases where you would need to have a transmitter
mast (or tower) mounted. As you go up in the microwave frequencies,
this comes to look like a more attractive alternative to more
expensive coax. The larger coax also has upper limits on the
frequency it can handle (not to mention high costs). Then some
frequencies are just not practical on any coax, period.

Try getting on 10 GHz and see what I mean.

> restrictions, but even that is not always true.

This is the kind of information we need. If it is the case that there
simply do not exist any choices where one can find a house without such
restrictions, then it might be possible to get another PRB or other
Federal pre-emption on such restrictions.

It might be possible to get it ruled that such restrictions apply only
to those NOT HOLDING A FEDERAL LICENSE for radio transmission, thus
leaving the application of such restrictions GENERALLY in place and
not causing the major uproar a total overturn of them might cause.
We are not fighting the cable industry on this particular issue, for instance.

> any kind of training.

Sounds like maybe the WRONG politicians are in control there.

Some volunteers definitely don't want to get involved with a lot of training and indeed prefer to do just certain things. A *PROPERLY* structured volunteer system will establish a set of things that you can rely on the volunteers to be able to do based on their training/certication. Don't "make" them take any training, just provide it and don't "depend" on them unless it is for an area they are trained in.

I have chosen, for lack of time to get involved, to bypass all training not directly related to storm/tornado spotting for the volunteer efforts I do with the county ESDA. But storm spotting is basically what I do, so I don't need other training. If/when there are other things I want to do, or if I have the time, I might get into some other training programs.

> during emergencies, too, wouldn't they?

I think what should be done here is that the properly type-accepted radios be made available. They are generally not much more expensive than ham rigs. I see some limited capability radios available for with NEW prices LOWER than ham rigs in one of the trade rags.

> Only inflammatory to people who believe in their inalienable
> right as a ham operator to transmit on any frequency to which they
> think they ought to be entitled by perceived loopholes in the rules.
> It just ain't so.

What loopholes? I haven't found any. I believe the FCC rule that allows hams to transmit "by any means" when an **EMEREGENCY**!! exists, is what was actually intended, so it is not a loophole. Those who transmit when no such emergency really exists are in violation of the rules, so again, it is not a loophole.

> least reduce the restrictions on its use.

There are no rules that apply to any form of "crossbanding". There are rules that apply to specific frequencies in many cases, but none that affect things done "crossband" that could be done (or not be done if that is the case) "inband".

A crossband repeater is just as legal as an inband repeater, and has to follow the same restrictions as well.

What Fred was referring to, I believe, is the fact that radios themselves tend to (initially for marketed ones) be ONE BAND radios. The 12cm and 13cm bands are close enough to be ONE BAND for the purpose of designing a radio. In fact they once were one band, and in the rules both stretches of spectrum are referred to as 13cm.

> using equipment that was type accepted for Part 90 service.

I modified my Icom IC-32AT so that it can transmit out of band. Did I need it? YES! But the reason is because of the design of the radio. You can choose to either have out of band, or not to. But "out of band" also includes some LEGITIMATE Amateur frequencies, such as 420-440 MHz.

There are also OTHER legitimate uses for a transmitter that is out of band. One of them is to drive a linear tranverter for broadband usage of the wider GHz band.

I know what Jay meant, though he didn't say it well enough for everyone to understand it.

The real question is when is it justified to violate the OTHER rules as the emergency rules allow for? David suggests that the operator should not do this. Do you mean that they cannot judge when the emergency exists, or are you saying there are some operators who would apply the label of "emergency" in non-emergency situations.

> The justification for the amateur radio service as an emergency
> communications resource for the community was never based on our
> ability to make our radios transmit on police frequencies. ARES and
> RACES do not build their disaster plans on hams using non-amateur
> frequencies during disaster operations. Hams are authorized to
> provide a unique and valuable emergency service, but only WITHIN THE
> FREQUENCY BANDS ALLOCATED FOR HAM USE.

There are levels of "emergency" involved here. Passing health and welfare traffic in and out of an disaster area would count as a low level of emergency and is well within what the B&P rules are about. These are the things we do *AS* hams.

If I encounter an accident where there is a serious injury, and there is going to be a significant increase in response time if I use other than

my radio on an public service frequency, then I am going to do it, but *NOT* because I am a ham; I'd do it if I was not a ham. The radio happens to be there because I am a ham. I would also cite amateur rules after the fact when responding to agencies about the matter.

I agree that the "emergency communications" that authorizes the existance of ham radio does not include calling on police/fire/medical frequencies for help. But that does not make it improper to do, or to be prepared to do it correctly and properly.

I've read both positions, and it still seems to me that you are not exactly arguing the same points. This is usually when discussion and debate turn into arguments and flame.

That's one way to fix intermod problems - get the insertion loss
up high enough! Course if you can stand 8 dB of loss, you can
just use a resistive attenuator :-)

In the limit, just leave the antenna connector disconnected.

I find that astonishing that there would be no 70cm activity in the Boston area. While I would expect 2m activity to exceed it, you just cannot put all that would be in Boston on 2m. More likely the person who made that comment either has a pre-conceived notion that 2m's level of activity is the minimum that can be called "active", or else just does not know what he is talking about.

In Boston I would definitely go for the dual-bander. But it depends on what you are interested in doing with it. The 2m band will definitely be more active, but the dual-bander gives you more options, including cross-band full duplex for most of the newer models.

Well, actually, YES. Something that has not yet been brought up is
97.111(a)(2) which states,

"(a) An amateur station may transmit the following types of two-way
communications:...
(2) Transmissions necessary to exchange messages with a station in another

FCC-regulated service while providing emergency communications."

This is quite clear. The only thing that could be argued is the word "necessary", but if NO OTHER FORMS ARE AVAILABLE, I say that this communication is necessary. The FCC has already clearly defined emergency and I won't restate it. I think that about sums up the legality of the comms. The usefulness or appropriatness of these comms are a separate issue.

My brother has an IC-R100. It is a fantastic radio.

I am considering purchasing an IC-R1, hence I would love to
see more comments on its performance.

I would particularly like to see a comparison made between
the R1 and the R100.

I believe that the R1 isn't quite as good as the R100 spec-wise
but it is hand-held. Just how much difference is there?
Does it fail due to spurious reception, etc.

I talked to the Kenwood rep at PACIFICON this past weekend. This is quoted from him (i.e., don't blame me):

The TH-77 will appear in the U.S. in about 4-5 months after FCC type accepting is completed. Price is unknown at present due to the current fluctuation of the Yen to the $. It will be packaged in a case something similar to the TH-26. It will use the same batteries as the TH-75/25/26 etc. It will support direct keyboard freq. entry, MR clear (a must for some). It is rumored to have dual 440 receive and it may do cross band repeat.

> lives should be limited, and not the other way around.

Your response is that of a well educated young engineer. That by itself does not make it wrong, but there are certain questions of perspective you might consider.

First, although you are representive of the average participant in these newsgroups, your good ol' boy from Texas in all likelihood is not terribly far removed from the statistical mean of scanner listeners in general, who are mostly pretty ordinary blokes. In that sense, the interview was probably not as biased as you would like to believe.

Second, I think your description of the origins of the United States leaves out an essential point. The assumption is true that the founding fathers were striving for limitations on the power of the state to interfere with the citizens' lives; but this striving was, in those times, as much a question of privacy as "unalienable rights". Indeed, given the changes in society since 1776, the average citizen's "expectation of privacy" then was considerably higher than now; and he would have been quite comfortable with the MIT sociologist's views.

Finally, the anthropological concepts regarding territoriality come into play here. Listening to the police, the hams, or even the government is one thing, but invading peoples' "personal space" by eavesdropping on their home

cordless telephones or their baby monitors is quite another. Their
"expectation of privacy" is likely to become a non-negotiable demand, and
since there are several hundred million more of them than there are of us,
guess who is going to lose - REAL QUICK!!!

Yes I agree the Toko helical filters have 7 or 8dB loss; but IMHO this is better
than an attenuator; an attenuator takes the wanted AND unwanted signals down
by 10 or 20dB (or whatever). The filter takes the wanted signal down by 7dB
but takes the rest of the garbage down a good deal more.
And yes, you *CAN* transmit through them as long as you keep it below 5 watts.
An RF-sensing circuit and double-pole changeover relay to take the filter
out on transmit would be the *nice* way of doing it.
But *WHY* should we have to do this when the filter should be *DESIGNED*
into the radio from the beginning. Come on Icom, Kenwood, Yaesu, Standard
build radios that are usable. Would Ford or General Motors or Toyota get
away with selling automobiles that stopped working when you got 50 of
them side by side??

I have a very big favor to ask. Soon, I am going to be looking for a workable HT (preferably dual-band and with DTMF capabilities). What can anyone tell me about the different manufacturers and their models? And prices?

Here is a list of manufacturers that I have sees ads from. If there is anyone that I missed, please add them to the list.

Please include any information you think would be helpful in my purchase. The key factors I am looking for are: Quality, features, and reliability versus price. (But then again, who isn't?) One important note though: I am very tight on money. I would like to hit Ham flea markets & discount warehouses (<- Do they exist?) first.

List:

Heathkit
Alinco
Kenwood
Motorola? <- Do they make Ham HTs or just commercial two-way tranceivers?
ICOM
Yaesu

Thank you very much in advance.

Scott (sehrlich@LYNX.northeastern.edu)

2024. Re: Alinco DR-110T

Newsgroup: rec.ham-radio
Date: 1990-10-15 14:20:27 UTC
From: genem@hpindda.cup.hp.com
Message-ID: <5120013@hpindda.cup.hp.com>
Source record: 7584

Modifications to the Alinco DR-110 2m mobile:

After installing the out-of-band receive mod on my Alinco 110, I accidentally pressed a couple of keys and found I could receive from:

130 -> 170 MHz + Xmit of this range
340 -> 380 MHz - no Xmit
870 -> 890 MHz - no Xmit

To modify the Alinco to receive out of band, perform the following steps:

Remove the top cover by removing the obvious screws. Be careful, as the speaker may stick to the cushion on the top cover. If it does, separate the speaker from the top panel and replace it back in its receptacle within the rig.

Positioned at the front of the rig, look near the tuning knob and you will see a little yellow jumper coming from behind the front panel, looping around and returning to the front panel. This jumper looks like it should have a tag on it saying 'cut me for more features'. Go ahead and take the wire cutters to this jumper.

Replace the top cover on the rig, get everything set back up and turn on the rig.

The next step is to reset the radio. If you don't remember its current programming, you may want to write it down at this time.

When ready to reset the rig, hold down the F key and the VFO/M key at the same time, turn the POWER off, back on, and then let go of the keys. The rig is reset and will display 144.00.

You will now be able to tune around, and transmit, from 130.00 -> 169.99 MHz.

To move to the next 'band segment', press F and then the MHZ key. The display will go the 340.00 MHz segment. F+MHZ again will get you cellular, and F+MHZ a third time will return you to the 2 meter segment. Happy monitoring...

OK, maybe you could receive through a filter with 8 db loss, but I would
really rather not transmit through one if I am running on batteries with
only a couple of watts.

>But *WHY* should we have to do this when the filter should be *DESIGNED*
>into the radio from the beginning. Come on Icom, Kenwood, Yaesu, Standard

I don't know offhand what the Q is on the Toko filter, but if you need to
make it a bandpass then you need at least 2. If you have a dualband HT,
then you need 2 sets. They may be small, but 4 or 6 of them gets to
be pretty substantial compared to the radio itself.

On the other hand, it might be reasonable to incorporate some lower loss
(bigger) filters into the mobile or home antenna installation that you
use with the HT. The amps a lot of people use already have T/R switching.

From: PJML@ibma.nerc-wallingford.ac.uk
Message-ID: <15.Oct.90.15
Source record: 7586

I am told that there is a mod. to the ICOM ICR1 that improves its overload capability; apparently in all modes, the 'first IF' filter is the same... its always the one used for Wideband (i.e. broadcast-band) FM. So the second mixer etc. is several hundred KHz wide open to nasties.
The mod. consists of narrower 'roofing' filters being switched in on non wideband operation.

There are also rumours of a mod. that gives SSB reception on the IC-R100 (Yow!) more news as it comes!

East coast (or near the East coast)?

Depend on what you call "active". There is certainly a lot of 440
activity in the New England area. Although with the advent of more
abundant 440 equipment in the past several years is changing the
flavor a bit, the style of activity is usually different. Used to be
the type of people on 440 were the frontier people and the ones trying
to escape from the "channel 19" flavor of a lot of 2m operations.

In the NE area there is also World Net. This is primarily a network
of about 8 full time linked 440 repeaters, with one 220, two 6 meter
and one 10 meter repeater. Although it is a "members only" network it
is not a closed system, and visitors are welcome and encouraged.
Regular users are asked to join in one of several ways. This can be a
small fee or donation of equipment or time, participation in a network
sponsered public service events or just regularly checking in to the
once a month emergency net.

Anyone interested in a free newsletter can send a business sized SASE
to myself, N1DXG, or N1EXQ at our callbook addresses. Optionally I
will be looking into providing a postscript version for email. I am
not sure how big the file is yet to see if it is worth it.

Mark:

HOPE (and pray if you are so inclined) that the US government and other governments around the world continue to demand the use of that spectrum. It is the ONLY thing at this time protecting our occupancy and use of it. One should always look before one leaps.

>I alway's thought that playing games real-time or else
>batch style mode would be fun. Would anyone out there
>be interested in playing Stellar Conquest ? I think
>it would be fun, but a move might take a long time, like
>maybe two weeks. How about chess, or checkers ?

I have a version of "go" about 3/4 of the way written ... it is all written in C using Borland's Turbo-C (it will compile with version 1.5 or 2.0), and it talks to the TNC using the ROM BIOS async routines, with the TNC in KISS mode.

The graphical interface and level three stuff is all written; I need to finish the level 2 stuff, and see if I can't figure out a way to better handle synchronization problems.

What I'd *REALLY* like to do is to make a chess version, but I don't know enough about the game to make it work. As soon as this go thing is done, I will post it in source form to rec.ham-radio.packet and invite a chess expert to help.

Does anybody have any thoughts that might help me with this project?

> This brings me to the deeper question. WHY DO WE NEED ALL THAT MICROWAVE
> BANDWIDTH??

Bob,
We need it because the microwave bands are the only place where we have both adequate spectrum and the possibility of fairly well focussed beams to efficiently transport large amounts of information by radio. Below 1 GHz or so there is neither the spectrum nor the directivity with reasonably sized antennas.
Ultimately we need the bandwidth because we need to transport a *lot* of information (not just TV) if amateur radio is going to survive in the information age by being relevant to information age services.

I've just given a rough abstract to my paper in the recent ARRL/CRRL networking conference proceedings. Please see it for details.

From: henryb@hpspdra.HP.COM
Message-ID: <12280018@hpspdra.HP.COM>
Source record: 7592

I have it in mind to buy myself a new toy soon, specifically an
"Oscar" antenna package. You know the kind of thing, 2m. and 70cm.
beam yagis of >10dB gain and circular polarization.
So could anyone post their views on commercial offerings, particularly
performance experience and perceived quality of construction.
I am aware of the offerings of Cushcraft, HyGain and KLM. Any others?
How important is a remote control left/right handed polarization switch,
and which packages include this?
Any views on the practicality of using an Alliance 110 rotor for
elevation? (I have a heavy duty rotator already for azimuth).
Thanks in advance, I suggest posting responses if of likely wide
interest.

]> So CCR's (deed restrictions) can be beat, if you have to...
]> Read the find print
]> and if you can avoid it... Don't buy a house that has them!
]
]Or at least have your lawyer read them and decide what you can and cannot
]do with them.

According to my ex-lawyer, who wrote and enforced deed restrictions,
there is another way to break them: abandonment. If you violate the
restriction, and after a "reasonable" time no-one challenges you on
it, the court MAY hold that they abandoned the contract by failing
to enforce it. Depending on the state it may invalidate the entire
set of deed restrictions, or it may invalidate it for just the clause
involved.

They can also be broken if they are discriminatory. Thus, if they
prohibit antennas, but they have been allowing TV antennas for a long
time, you can require them to either ban all the TV antennas, or
grant your antenna. Of course, the TV antenna owners can use the abandonment
argument to keep theirs, so again you win.

The problem is that both of these routes are expensive, risky and can
lead to neighbor problems (which is bad new for everyone). We had
a ham here in AZ who spent $22,000 fighting deed restrictions that had
prohibitted him from putting up a dipole, and he lost the case.

I am not a lawyer. These are just my opinions. Your mileage may vary.

]into the radio from the beginning. Come on Icom, Kenwood, Yaesu, Standard
]build radios that are usable. Would Ford or General Motors or Toyota get
]away with selling automobiles that stopped working when you got 50 of
]them side by side??

Well... Icom, Kenwood, Yaesu etc seem to be doing just fine without them.
I've noticed that most hams look at sensitivity specs, and wouldn't
even know how to read an intermod/blocking spec - that's probably why
we see extremely sensitive HT's. Furthermore, you really do want
high sensitivity for portable operation when you are away from all
the RF sources. I would guess that MOST HT operation is away from
these sources. For this reason, I suggest a switchable attenuator
(MUCH cheaper) for operation around high RF sources, and that can be
switched out when not needed. I think an HT with this feature would
handle almost all cases. For those few cases where it wouldn't
work (need to hear weak signal while near strong sources), I would
suggest that the user use something external.

If you look at repeater sites, they use LARGE, EXPENSIVE cavities to
achieve what you want: minimal sensitivity to other signals. In the
repeaters we use (modified Motorola), there is a stiff front end and
helical resonators. All of this stuff is still not enough to prevent
desense and intermod.

RF inter-operability is not an easy problem. Expecting manufacturers
to solve it in tiny HT's is just unrealistic.

> > Okay, you've gone WAY wrong.

First off, Bob, you've missed the dictional reference. You asked, after explaining why we need so _little_ bandwidth, if you had gone WAY wrong. I simply replied in kind, trying to prove that we do need more b/w.

>I say: .. and have a good S/N ratio... HEY FRED, I was trying to say we
>NEED the bandwidth, not that we need even less.

Then why do you average over a long time? That causes the bandwidth requirement to go down, not up. My posting is to demonstrate why we need more b/w than you implied we need.

> > Second, what is the latency we're tolerating? We do a lot more than

> > bps, it's hopeless.
>I say: Don't you have computing power locally? Can't you transfer the mail
>in bulk and read the individual messages locally? ...

No, you can't, unless you recalculate the News paradigm. The News server I'm reading you on gets over 1100 newsgroups. I read a few hundred messages a day, out of tens of thousands. In some groups, I only scan the titles and pick out the interesting ones. With the "local computer" paradigm you mention, every user would need a news server, or would wait. And to be a server, you'd have to pump up the volume of messages.

That's not a "mainframe does everything" attitude, it's an efficient model of distributed processing.

>I then talked about how much bandwidth TV (raw analog or 1 Mbit/s compressed)

> > a little jerky. (That's hardly an ATV price range.) But "full motion"
>I say: Why do hams need more that "talking heads" ;-(Also, today's price
>won't protect bands tomorrow.

Which side are you on? I'm arguing for hams to have the b/w. You
implied that network quality video could be done in 1 Mbps, and that's
not true. Talking heads is fine for hams, but compression is currently
too expensive. I agree that hams tomorrow could have it. We may need
it.

>I say: ABC news has been using compression to
>get two TV pictures into 45 Mbit/s (T3) between NYC and DC for a number of
>years. Do you complain about their picture quality?

When's the last time you watched a horse cavalry scene on the news?
Half of a T3 is 22 times more than 1 Mbps. That's barely compressed.

If we really were concerned about our bandwidth, we'd abolish 1200 bps
AFSK packet.

Some rule changes happened back in the seventies that made it possible to request calls if you didn't have 25 years. On July 1, 1977 (??) the FCC opened special call requests to any Extra. At the time, there were only 70 or so 1x2 calls left in CA. I was lucky enough to get my code speed to 20wpm and pass the Extra around 7/1/77 and I got me (oops-that's "my") third choice of call (I submitted a list of 20 calls just in case). Seems to me some friends did the same thing and got some of the 2x2 calls (AA6EE comes to mind) way before the FCC started giving those calls. Sometime after that, they changed the rules again, and you just had to take what they gave you.

2040. Re: DAB taking ham freqs ?

Newsgroup: rec.ham-radio
Date: 1990-10-15 18:08:36 UTC
From: rc@CMR.NCSL.NIST.GOV
Message-ID: <9010151808.AA11371@cmr.ncsl.nist.gov>
Source record: 7600

Here is my reply to a number of comments on DAB taking ham microwave freqs.

I said:
>> code license, I
>> conclude that the only ham application likely to NEED all our microwave
>> bandwidth is the transmission of TV images.
David Stark replies:
> It does seem to be the logical candidate among the KNOWN modes.
> Or how about spread spectrum? Are there any calculations available on
> how many hams using spread spectrum technology could occupy xxx MHz?
My answer:
As a rough estimate, I hear that you can get almost as many spread spectrum (SS) stations into a band as you can using narrower-band modes (like FM or FSK) sending the same info. There may be some capture-effect problems, however. The idea of far-out sidebands from SS really frightens the weak-signal crowd.

>>>>>>>>>>>>>>>>
Kevin J. Rowett says:
> Seriously Bob, your statements seem very politically motivated than based
> in reasons...the impression I get about your basis for spectrum
> management is NIMBY...Not In my back yard! You'd like AR to support
> your interests in weak signal work. At the same time, your willing
> to sacrifice our usage of spectrum to keep yours.
>
> Just waht does the weak signal work contribute to the hobby that makes
> it deserve more than other sections of the hobby?
I reply:
Kevin, I think you DID read me wrong. I suspect that a very few MHz of most microwave bands CAN be preserved without much effort. That would be enough for the weak-signal (and probably the digital) crowd. We need to have a clear reason to keep the rest.

>>>>>>>>>>>>>>>>
Gary Coffman points out:
> The numbers in your article didn't allow any guard band. Assuming reasonably
> state of the art equipment, doubling your numbers should allow acceptable
> guard band.
I say:
You're right. But my other numbers are certainly in error by at least as much!

Gary goes on:
> Considering your 35 kbs assumption, I certainly want better thruput than
> that. Floppy speed of 500 kbs would be acceptable now, but I do want to
> be able to interact with a X client/server pair in a snappy manner.

I say:
You're talking about burst speeds here, not average rates. Does your floppy transfer data more than 7 to 10% of the time? Not in any well-designed application. I'm talking about an average of 35 kbit/s of a 1 Mbit/s (burst-rate) channel. You're not convincing me yet. Same agrumemt re: X-windows.

Gary goes on:
> I do want to be able to program distributed computer systems. I do want to
> transmit high definition video in real time. I want to do things that
> are currently impractical because we don't have the speed/bandwidth
> needed yet. Predicating future spectrum needs on current digital usage
> is a mistake. There are many potential digital uses that currently aren't
> being done because the technology to give us the needed thruput isn't
> available to amateurs yet.
I say:
Now you are getting into some stronger arguments. We both agree that video is a clear user of wide bands. We've had these microwave bands for many decades. How can we say we don't have the speed/bandwidth yet? Your "don't have" means "can't BUY cheaply". Distributed computer systems don't seem like a mainstream activity, at least I wouldn't expect hundreds of nodes to be simultaneously active. Today it's worthy of a journal article when someone teams a number of SUNs on a single job with DOE or DARPA funding, isn't it?

Gary goes on:
> As one example consider an autonomous mobile robot.
I say: Autonomous means not connected to the outside world = no communication.

Gary goes on:
> It transmits high
> definition video of it's surroundings. It's movements are controlled
> by a set of cooperating subprograms running on a group of desktop
> computers all connected by a distributed network. Sounds fantastic
> doesn't it? Give me the thruput and I know several people who would
> like to take a crack at it.
I say: We've had the bandwidth for decades......where are the people? This sounds like a worthwhile and interesting one-off FRINGE activity. People like Chip Weems in the DARPA image-understanding community talk about special SIMD machines for the earlier steps of image processing, not at all like PCs. Except for the TV, about 30 updates a second is MUCH more than enough and takes very little communication bandwidth. Terrain-following aircraft control systems operate on a 30-updates-a-second cycle, at supersonic speeds....

Gary goes on:
> The lower microwave bands are ideal for
> this application since conventional omni antennas are still practical.
> At 10Ghz and above tracking problems would become severe at fairly
> short ranges.
I say: Agreed, though I think people like CMU are using 70 cm, or so, for their robot vehicles.

Gary goes on to mention radar, etc., and then says:
> There's lots more than weak signal work being done at microwave frequencies.
> Not a lot of people are doing it yet, but as more people learn how to
> do it, the activity will hopefully grow. If we lose large chunks of
> spectrum, it'll die on the vine. The few remaining slivers will only
> be useful to the weak signal DXers and some great experimental work
> will be lost.
I say: That's why I want to save WIDE bands, but we need good arguments to
win. "Going to use", "should use", "will need", "will grow" won't be enough.

It disappeared about the same time that it got incorporated into QEX. My guess is that whomever edited Gateway had usenet access and posted it gratis. Whomever edits QEX/Gateway doesn't have usenet access or doesn't think it's a good idea (in these times of ham periodicals folding up) to give away the goods. You can subscribe to QEX/Gateway through the ARRL. (You don't have to be a member, but it costs more if you're not.)

It will be hard for any of us in the US (or anyone in North America for
that fact) to help too much since Icom is not importing these radios
into this market. Uniden has either sued (or has threatened a suit)
against Icom for scanning patent infringments, and the radios are
in limbo at this time.

(I'd like to thank Uniden for this by boycotting their lousy sccanners
but I would think Icom would figure a way to get their radios into
the market.)

Where did you buy your R100?

Yep ....

The league maintains a full time lobbyist, and a PR firm in the
Washington area whoose main function is to lobby congress and
keep issues related to the hobby in front of congress. They
also have a full-time legal type to deal with matters before
the FCC. Fact is that they are spending a great deal of time
and effort to prepare for the next World Administrative Radio
Conference which where a number of issues relating to the
future of ham radio will be decided.

>cation. I'm talking about an average of 35 kbit/s of a 1 Mbit/s (burst-rate)
>channel. You're not convincing me yet. Same agrumemt re: X-windows.

How can you say that a well designed application "should" be compute bound
rather than i/o bound when you don't know what the application is?

Someone said (not sure if it was you) that the computer should plan ahead
and pre-fetch mail messages etc so a crummy response time wouldn't impinge
on the user. The ultimate extention of that is to just mail a box of tapes
to the other node daily and skip the microwaves altogether. Lots of data,
long response time. same deal.

Even ethernet at ~10 megabits/sec gets sluggish with a few too many nodes.

>Now you are getting into some stronger arguments. We both agree that video is
>a clear user of wide bands. We've had these microwave bands for many decades.
>How can we say we don't have the speed/bandwidth yet? Your "don't have" means
>"can't BUY cheaply".

This is supposed to be AMATEUR activity. Cost is a legitimate object.
This is another area where time = 1/money.

That's known as evolving technology. ATV is a lot more popular now because
cameras are cheap enough that a lot of people can afford them. ATV on
microwaves will get more popular as the equipment gets cheaper.. as will
microwave in general.

> 1. And how do you know it is an RCC split the requestor wanted? You
> know for sure that that split is used exclusively for RCC, and not by
> something else as well? There is a whole world of

No, but in context of the discussion it is immaterial. Several
people leapt to this person's defense on the grounds that
transmissions by ham operators on non-ham frequencies was somehow OK
"under the right circumstances." Circumstances to be decided by the
individual ham, presumably.
I'm still waiting for the original requestor to explain what
"non-ham repeater" (his words) he was trying to work with amateur
equipment, and why.

> 2. Last time I checked, there was no regulation about not using
> strange splits for oddball use in the ham bands. Please post chapter and
> verse if there is.

Also irrelevant. The original requestor specifically said that
he was trying to access non-ham repeaters.

> 3. I don't think hams need out-of-band capability. However, being a
> ham is not exclusive with being an EMT, Firefighter, MARS, or CAP.
> Neither is being a ham mandatory for any of those. So, it is feasible for

Aye, there's the rub, those last 5 words. The out-of-band
transmissions, no matter how well-intentioned, are still illegal.

> 4. There is one real good reason to use modified ham gear when

So far, the FCC has not offered to waive Part 2 (type
acceptance) to save money for volunteer agencies or taxpayers. This
is an excuse, not a reason.

> transmitting RCC splits, at RCC frequencies, is NOT illegal. It is not
> illegal to own a radio capable of transmitting at the local police
> frequency. It is not even illegal for a non-ham to own ham transmitters.

It is not unreasonable to interpret ownership as intent to use.
If you can't use it, why go to all the trouble/expense of owning it in
the first place?
I don't really care what the next ham does with his equipment,
or who supports the manufacturers with their purchasing dollars. I do
care that some jerk is going to modify his HT "because there are no
rules saying I can't" and abuse the privilege to the detriment of the
rest of us hams. "Ham operators" are accused by the press of causing
all sorts of havoc, from interfering with airplanes (when an illegal
CBer was the culprit) to wrecking TV reception to illegally
eavesdropping on cellular phone calls (everyone with a radio must be a
ham). Why invite such bad press by actually possessing equipment
capable of illegal operation?

You may have a better bergaining position now that it's a buyers market.
However, some housing tracts (and most condo tracts) have CC&Rs that
spell out specific antenna limitations. The seller of the home will have
no choice if this is the case. In Santa Clara County, no housing tract
built since 1971 is WITHOUT a CC&R that prohibits some forms of antennas.

2048. 1970 Student Information Net

Newsgroup: rec.ham-radio
Date: 1990-10-16 02:59:11 UTC
From: fs024@zeus.unomaha.edu
Message-ID: <2475.271a2323@zeus.unomaha.edu>
Source record: 7608

I am attempting to assemble an accurate historical account of the Student Information Net of about 1969-1971, its role at Kent State, and related coordination of campus protest regarding the U.S. involvement in Vietnam. Bits and pieces I have gotten so far have been interesting, but incomplete and sometimes contradictory. It seems that the legend aspects of this net have overshadowed its reality. Here is a sampling of what I have so far:

1. Brief, second-hand accounts from WA3VZW about coordination of protests at the University of Maryland including human blockades of U.S. Route 1 along the campus and something called "The Big Flush" which was (I'm not making this up!) a simultaneous flushing of campus toilets to overload the plumbing. This information, plus QSL cards from the UMARA archives, suggest that the SIN took the form of a 40-meter voice net with Cal-Berkeley serving as net control.

2. Brief anecdotal information from Cliff Stoll, K7TA about ham-operators on the Kent State campus being the only source of information out of the school as the protests and confrontation with the National Guard were happening. Most of the information was relayed on an HF band via Morse Code, according to Cliff.

This endeavor will be the subject of an academic paper, and possibly a later publication in some form. My goal is a serious, objective, and tasteful account of the Student Information Net with due respect to all players involved. Amateur Radio gets a notoriously short-shrift in the so-called "Establishment" media to begin with, and the SIN is even more obscure. Getting the facts down and documented will go a long way towards preserving the memory of those student activists involved, including the ones that died at Kent State.

Since my objective is to be factual, I am interested in first-hand accounts, references, and documentation much more than hearsay or secondhand information. Information about any other sources like college ham club archives or student newspapers would also be helpful. My access to Internet is quite limited (A friend of mine posted this to Usenet for me) so I would much prefer that you write me via U.S. mail. My results will be passed along the net in a yet-to-be-determined form.

Please give this message the widest dissemination possible, on Internet, amateur radio/packet, mail, and word-of-mouth. Thank you.....

From: AGENGCC@OSUCC.BITNET
Message-ID: <9010160412.AA04974@ucsd.edu>
Source record: 7609

I have had some success using a helicaly wound vertical dipole on 15 meter CW <NO FLAMES PLEASE I work cw because fone annoys my XYL>. Worked FL, OH, NY, CA WA and OR yesterday. The antenna is made by wrapping two 3.5 ft. fiberglass whips with small magnet wire with about 3/16 in. spacing. The helixes are in opposite directions (I don't know if this makes any difference). It resonates about 21 Mhz. Use a grid dip meter and trim or add wire as needed to make it resonate. If you can't borrow a grid dip meter try about 10% more wire than is called for in the quarter wave formula. The antenna should be adjusted in place because the resonance will vary considerably with the location of the antenna. I fed the antenna direct with 50 ohm coax and a tuner.

If I were making another I would use 1/2 inch PVC pipe with a coupling in the center for portability and convenience. I didn't worry too much about spacing I just tried to keep it even. Conventional wisdom dictates that the coax should come off at right angles but the antenna doesn't seem to care. The rig is not grounded and it is not hot with 20 watts out of a Yeasu FT7. I can watch a cable TV that is 8 ft. from the antenna.

This is the first indoor antenna I have had that I consistently get as good a signal report as I hear.

2052. Commercial Gear (Info wanted)

Newsgroup: rec.ham-radio
Date: 1990-10-16 05:44:05 UTC
From: guhsd000@crash.cts.com
Message-ID: <5062@crash.cts.com>
Source record: 7612
Cross-posted to: rec.ham-radio,sci.electronics

This message is mostly on behalf of a friend, but I am interested in this also:

I'm looking for documentation of all types of commercial equipment relating
to comercial broadcasting. Things of particular interests are manuals and
diagrams, etc of Commercial FM Circular Polorized broadcast anntennas.
Needless to saw, Jampro wasn't too keen ofn the idea of sending us detailed
diagrams. We just want to do some experiments with circular polarization,
and can't dish out the $40,000 for a basic C.P. Antenna.

Also, We have guts and parts (he's a collector of such stuff) of all types
of transmitters and exciters, and I was asked to see if anyone may have
information on (older) commercial transmitters and exciters. In particular,
we're looking for documentation for CCA 10 Watt direct FM exciter, which
the manual was lost a few years back, and CCA is now out of business.
I belive the CCA is from the 60s to mid 70s, and will run 80Mhz to 174Mhz
with the proper tweeks and mods, and was intended for commercial broadcast
as well as use for "Fixed" use, such as in a Local Gov't VHF system, and
is crystal controlled. (That bandwith requires component changes...)

Also interested in Collins tranmitters, other CCA equipment, millitary, GE,
etc...etc....

Just for info, Fair Radio sales in Lima, Ohio in their Fall 1990 catalog are
advertising rhis:

Technical Materials Corperation's GPT-10K
2-32 Mhz SSB 10 Kw (!!) transmitter
"Appears complete except 4cx5000a PA and 8295A Drivers"
2700 Lbs Shipping Weight $4,000 (Not Bad...)

It might just cost another $4,000 to ship it!

I must be missing something. David expresses outrage that the League
didn't check with him personally when the board voted to hire a couple
of staff people. Then somehow this is construed to mean that there
is no representation, when in fact we elected the board.

Nada. Zip. PRB-1 doesn't say squat about restrictive covenants. Antennas
are generally prohibited in subdivisions platted within the last 20 years.
(And the places that did allow antennas were in unsuitable neighborhoods
for other reasons, such as houses being too old, bad location, etc.). I am not
willing to buy 5 acres of rural land just to put up a vertical or 2 and some
wire antennas (which was the alternative available). There isn't a whole
lot of land that isn't restricted in this way anymore.

CC&R's are nasty because they are not consistant. They vary widely, and
in ways that are not rational to an observer (e.g. two adjacent lots
may have CC&R's that are completely different). Also, you as a buyer
have *no* choice about accepting the CC&R, as they are filed with the
land and run with it. Since they are inconsistant, it means that each must
be fought individually, and there is no precedent being built by getting
one changed. I feel that there are may also be some constitutional questions
in situations where *no* antennas are allowed. (My last house had CC&R's
that prohibited all antennas. I had thought about putting up the tower
and sweetly asking them to take out their garage door openers if the neighbors
protested, but I decided against it :^>)

Covenant violations can get nasty and expensive if the neighbors are
a**holes. I personally don't like spending time talking to lawyers and judges
to establish an expensive legal point. Also, many people who would be
interested in radio just don't care to fight with architectural committees,
neighbors etc. just to put up an antenna.

I have a KLM 2M-14C and a KLM 440-18C for my oscar antennas. They are
well constructed, and I've never had a problem with them. The choice
of number of elements will depend on which satellites you want to use,
though. The two antennas I use are somewhat short for use with
Oscar-13 except when its pointing angle is very small (ie. its beams
are aimed in my general direction). This occurs each apogee, so it's
not a major problem, but you won't have access to the satellite during
other portions of its orbit.

For Microsat work, my antennas are just the right trade-off between
beamwidth and gain. A longer antenna would be more difficult to keep
aimed at the rapidly moving satellite.

I use a U-110 for elevation control, but would not recommend it unless
you absolutely could not afford a better rotor. It doesn't have continuous
antenna location feedback, only a very poor "click-type" indicator. For
satellite work, you really should have a much more accurate elevation
indicator. In addition, you would have to add you own antenna position
feedback to use computer-controlled antenna aiming (which is a BIG plus
on the low-earth-orbit satellites).

2059. DR590T Remote Control

Newsgroup: rec.ham-radio
Date: 1990-10-16 12:13:49 UTC
From: szarekw@LONEX.RADC.AF.MIL
Message-ID: <9010161213.AA16679@lonex4.radc.af.mil>
Source record: 7619

From: szarekw (William J. Szarek)
To: info-hams@wsmr-simtel20.army.mils
Date: Tue, 16 Oct 90 08:04:03 EDT
Subject: DR590T Remote Control
X-Acknowledge:

And now the long awaited jinglish - english translation for the remote control
of the DR-590t by a transceiver with DTMF. (and as a bonus a big disappointment)

The following is a direct copy of the info Alinco was kind enough to send
me. [my comments appear in these brackets]

1. Set frequency
a, go to vfo mode and set desired frequency on the DR-590T, and fully
open squelch. ("Busy" indicator will appear).
b, Set same frequency on the remote Transceiver, and fully open squelch.
[not necessary]

2. Set Remote Channel and access code.
a. enter C10 on the DR-590 Touch Tone Mic Pad. *the frequency display
will flash).
b. Enter channel selection (one numerical digit (1-4) and an access
code (three numerical digits) on the DR-590T touch Tone Mic Pad. [it would
be good for you to compare this part with the DSQ function descrition in
the manual so that you can see "What is realy happening here"]

3. Enter DSQ function in the DR-590T
a. enter C!@ on the DR-590T Touch Tone Mic Pad.
(DSQ indicator will flash)
b. Push the PTT on the DR-590T Mic.
DSQ indicator will stop flashing and the "busy" indicator turns
off)
c. Press the "f" (function) key and the MHz (up) key. The DSQ starts
flashing again, and there will be a confirmation tone.

4. Access Remote Transceiver to DR590T
a. From the remote transceiver, transmit same DTMF access code (three
numerical digits) as set into the DR-590T. The "Busy" indicator turns on
the DR-590T (normally, you will hold the PTT on your remote transceiver and
push the appropriate DTMF tones). [???? Jinglish again ?!?!?!?]

5. Initiate remote control commands
a. From the remote transceiver, transmit the desired "C" code (see
page 14 of the DR-590T manual) from the dtmf Touch Tone Pad.
b. If you want to perform an additional remote commands you must
remember to put the remote transciever in the same frequency that the DR-590T

may be in. [how in the hell do you know if you are remote from the DR-590 and if you err durring a remote command how do you recover . . . more on this later] Retransmit the access code and the desired "c" code.

6. Cancelling the remote control function and turning off the dsq function
a. If the DSQ indicator is not flashing, enter C12 on the touch tone pad of the dr-590t. the dsq will start flashing.
b. With the dsq indicator flashing, press the MHz (down) button once. The dsq indicator will turn off.

--End of instructions from Alinco --

Now the bummer
This function does not allow you to control frequency selection/etc on the other band. (i.e. from 440 you cannot switch over to 2meters and change frequency and then go back to 440). You cannot operate this function in conjunction with any of the memories, you must remain in VFO mode. This function does not opperate in cross band remote mode.

I am a bit miffed that Alinco didn't see this through. They could have created the all time worlds greatest mobile rig that would allow one to access it via 440 and then work any of your favorite 2 meter repeters operating as a remote base. They even saw fit include a dtmf function that allows you to remote key the transmitter (rather than running as a repeater). This in conjunction with the other functions that are 1/2 implemented certainly say something about Alinco.

Counter point
It is still a great radio and I would buy it again still knowing what I know now. The only differance is that I wouldn't be as disappointed when I found out that the rig doesn't "really" do all that Alinco says it can do.

Any way I hope you enjoy your rig as much as I enjoy mine.

2060. Code & other requirements

Newsgroup: rec.ham-radio
Date: 1990-10-16 13:03:53 UTC
From: szarekw@LONEX.RADC.AF.MIL
Message-ID: <9010161303.AA17152@lonex4.radc.af.mil>
Source record: 7620

Congrats to Mike Gauland on his new ticket. Yes I suppose enjoying CW is
"unpopular" politically but you are not alone. Many people like code we
just don't talk about it ....

Tad said that 5 upm is bare usable . . .Right-on! Mike, now you will find
yourself sitting for hours having a cw qso with someone. You will have a
lot of fun, no doubt at all, but . . . when you get up in speed to 13, 15
and 20 wpm you will begin to find you have just as much fun (maybe more)
and you still spend hours at the rig, only difference is now you can actually
talk with your key.

example
Novice: (this takes 10 min. so you must ID every time)
kx7xxx de kz7zzz bt
blah blah blah . . .
blah blah blah . . . [z transmission]
etc
kx7xxx de kz7zzz kn

Extra: (this takes 10 min.)
kx7xxx de kz7zzz bt
blah blah blah . . . [z transmission]
blah blah blah . . .
etc KN
blah blah blah . . . [x transmission]
blah blah blah . . .
etc KN
blah blah blah . . . [z transmission]
blah blah blah . . .
etc KN
blah blah blah . . . [x transmission]
blah blah blah . . .
etc bt
kz7zzz de kx7xxx KN

So cw becomes more converational. Eventually you will be able to copy it
in your head just like when you listen to someone talk. Trying to realize
this (for myself when I had my novice) was like being a child who barely
knows the alphabet and trying to read shakespear! Keep working at it and
you will be there in no time, all it takes is daily practice.

The reason (as I see it) for the "class" structure is to reserve some portion
of the band for "high speed" cw operators. If you look at the band plan,
you dont gain all that much spectrum by upgrading. And unless you want some
of the other privalages (being a VE) you really have no reason to upgrade
unless you want to get into high speed cw and use those reserved portions

of the band. I suppose there are those that think of the classes as a caste system and that Extras are "better" than generals, or techs but that is a realy stupid reason to go through the trouble of upgrading.

By the way I support the no code licence as long as the CW bands don't change so that we can still have our kind of fun. [a possibly lame attempt to quell a flamefest :-)]

Keep working at it mike, hope to hear you in the lower edge of the band some day soon.

2061. This whole Code Test thing

Newsgroup: rec.ham-radio
Date: 1990-10-16 13:10:53 UTC
From: MEHARP01%ULKYVM@pucc.PRINCETON.EDU
Message-ID: <9010161408.AA01114@ucsd.edu>
Source record: 7621

Here's the exact quote from FCC rules regarding exam grading. This is Part 97.29 (C) entitled "Examination Grading."

"An applicant passes a code element if he/she proves his/her ability to transmit correctly by hand key (straight key or electronic keyer, but not a keybaord keyer) and to receive correctly by ear texts in the international Morse code at not less than the prescribed speed during a five-minute test period. Each five characters shall be counted as one word. Each punctuation mark and numeral shall be counted as two characters."

Enough of this, now. The guy is wrong. Face it.

ABUS34 KIND 151416
INZALL-151800-

PUBLIC INFORMATION STATEMENT...AMATEUR RADIO APPRECIATION WEEK...
NATIONAL WEATHER SERVICE INDIANAPOLIS IN
900 AM EST MON OCT 15 1990

GOVERNOR EVAN BAYH HAS PROCLAIMED THIS WEEK...OCTOBER 14 THROUGH 20 1990
...AS AMATEUR RADIO APPRECIATION WEEK IN THE STATE OF INDIANA. ALL HOOSIERS ARE ENCOURAGED TO RECOGNIZE THE IMPORTANT CONTRIBUTION MADE BY THESE DEDICATED VOLUNTEERS.

INDIANA AMATEUR RADIO OPERATORS PROVIDE INVALUABLE SERVICES WHICH HELP SAVE LIVES AND PROTECT PROPERTY. THEY PROVIDE COMMUNICATIONS EQUIPMENT AND VOLUNTEER THEIR SERVICES TO NATIONAL WEATHER SERVICE OFFICES DURING TIMES OF ADVERSE WEATHER.

AMATEUR RADIO OPERATORS PLAY A MAJOR ROLE IN THE NATIONAL WEATHER SERVICE WARNING PROGRAM. THE WEATHER SERVICE DEPENDS ON TIMELY REPORTS OF TORNADOES...WIND DAMAGE...HAIL AND FLASH FLOODING FROM TRAINED SPOTTERS. MANY SEVERE WEATHER SPOTTERS ARE LAW ENFORCEMENT OFFICERS... FIREFIGHTERS AND EMERGENCY MANAGEMENT (CIVIL DEFENSE) OFFICIALS. BUT ABOUT 30 PERCENT OF SEVERE WEATHER SPOTTERS ARE AMATEUR RADIO OPERATORS.

DURING MAJOR SEVERE WEATHER EVENTS AMATEUR RADIO OPERATORS WORK OUT OF NATIONAL WEATHER SERVICE OFFICES...SETTING UP SPOTTER NETWORKS COUNTY BY COUNTY AS NEEDED. WEATHER SERVICE PERSONNEL FEED SPOTTERS INFORMATION ON STORM STRENGTH AND LOCATION BASED ON RADAR...AND THE SPOTTERS RELAY REPORTS OF SEVERE WEATHER BACK TO THE WEATHER SERVICE. THESE SEVERE WEATHER REPORTS HELP WEATHER SERVICE FORECASTERS TO DECIDE WHERE AND

WHEN TO ISSUE TORNADO...SEVERE THUNDERSTORM AND FLASH FLOOD WARNINGS.

DURING THE JUNE 2 1990 TORNADO OUTBREAK...DOZENS OF TIMELY REPORTS FROM AMATEUR RADIO OPERATORS THROUGHOUT INDIANA ASSISTED IN THE WARNING PROCESS.

IN ADDITION TO SEVERE WEATHER OPERATIONS...INDIANA AMATEUR RADIO OPERATORS PROVIDE DAILY RAINFALL OR SNOWFALL REPORTS TO THE NATIONAL WEATHER SERVICE HYDROLOGIC PROGRAM. THESE WET NET REPORTS ARE USEFUL IN PREDICTING RIVER STAGES AND FLOODING.

AMATEUR RADIO OPERATORS ARE A DEDICATED GROUP OF VOLUNTEERS WHO HELP THE NATIONAL WEATHER SERVICE PROVIDE THE BEST POSSIBLE WARNINGS AND FORECASTS TO THE PEOPLE OF INDIANA. HATS OFF TO THE INDIANA AMATEUR RADIO OPERATORS.

2063. CW Filters

Newsgroup: rec.ham-radio
Date: 1990-10-16 13:33:10 UTC
From: wrb@cbnews.att.com
Message-ID: <1990Oct16.133310.1130@cbnews.att.com>
Source record: 7623

I have a Heathkit HW-100 that I use almost exclusively for CW (yeah, yeah I know). I picked it up used (no kiddin') and it has the SSB (2100 Hz) filter in it. I've found filters available from Fox-Tango and I think I want to get one. My question is this: they have 400 Hz and 250 Hz filters - do I want the tighter one, or are there tradeoffs between tighter filters and wider ones (i.e. is it difficult to tune, etc.) There is no provision for switching between two filters, so unless I rig something up, I will be stuck with whatever is in there. I know I won't be able to work SSB, but that's OK (with ME - only with ME). Any advice would be appreciated.

Oh yeah, one more question: If I am in an accident and my car will blow up in a few minutes and there is no one else to go for help and my HT has been modified to work on police bands and there is no repeater around (whew), is it OK to call the police on it? But wait! Blood from a severed artery has leaked into the HT and ruined the microphone! I'll have to use code! Thank God I had to learn it to get my license. But my VE never tested me on sending code with a HT mic button! Should I sue him/her if I get out of this alive? What a dilemma! :) (Sorry, I couldn't resist)

>I am very tight on money. I would like to hit Ham flea markets & discount
>warehouses (<- Do they exist?) first.
>
>List:
>
>Heathkit

The current stuff sold by Heathkit is rebranded Japanese equipment. I don't know who is making their equipment this week, but lately they've been selling rebranded Yaesu HF gear and Standard Electronics of Japan HTs. Buying from Heath is kind of like buying from Sears. You won't get the best deals and you may have trouble getting parts after they change vendors, but the equipment will be generally serviceable.

>Alinco

Alinco is a minor Japanese inport. Features are great, price is reasonable, but quality is spotty.

>Kenwood

Kenwood is a major player in the ham market. Be aware that these are high margin products. Look for major discounting. The quality of the HF rigs is top notch. The VHF/UHF equipment quality is spotty. Their HTs are small and feature laden, but some models are fragile.

>Motorola? <- Do they make Ham HTs or just commercial two-way tranceivers?

Motorola makes several grades of HT that can be used in ham service. They have a limited number of channels (from 2 to 16) and don't have the gee whiz features of the Japanese radios. They are extremely rugged physically and hold up well in extreme RF enviornments.

>ICOM

Icom is a major player in the ham market as well as the commercial market. Their equipment tends to be pricey. Their philosopy tends toward technical wizardry rather than featuritis. Their receiver frontends generally feature a high intercept point and their introduction of direct digital synthesis has resulted in radios with extremely low noise floors. Except for the micro 2, their HTs have been known for their ruggedness. The IC-2AT is the standard by which ham HTs are judged. Their VHF/UHF gear is generally excellent. They have been playing catchup to Kenwood at HF for some years. Their new HF series is superb.

>Yaesu

Yaesu has been considered a second tier company in the US ham market. This is changing rapidly. Their new HF equipment is top line and their VHF/UHF gear is excellent as well. In particular the FT736 is excellent as is the FT1000 HF rig and the FT470 HT. These radios tend to be feature laden with some sacrifice in intermod performance. Pricing is somewhat better than Kenwood or Icom.

What do I own?

I own and abuse the IC-2AT, the IC-4AT, and the whiz bang FT470 HTs. Lately I find myself carrying the FT470 most often except when I will be in an extreme RF enviornment like a mountaintop repeater site.

I own and abuse the IC-900 and IC28H mobile rigs. I have had no problems with either of these rigs even though the IC-900 is mounted in a Jeep.

My main VHF/UHF base rig is currently a Kenwood 790A. This radio has caused me a world of grief. It replaced a IC451A and a much beloved IC211 that suffered a severe lightning hit. The Kenwood suffered a 440 power module failure within the first month. The radio is advertised as suitable for use with amateur satellites, yet the narrow filters are not accessable by the downlink receiver. It has frequency tracking for satellite use, but only if you hold a button in while tuning. I intend to replace this radio as soon as possible.

On HF I use an IC735 transceiver both mobile and base. It may not be the DXers dream, but the receiver is incredible and the transmitter is solid. My previous HF rigs were an unsatisfactory IC745 transceiver and a wonderful pair of Drake Twins.

My recomendation for an HT? The FT470 dual bander has more bang for the buck than anything else. A used IC2AT would be the best single band HT for the money.

Gary KE4ZV

Disclaimer: I don't work for Icom.

> be capable of RCC splits with amateur transceivers?

Because it is there! This is the United States of America... that used
to mean freedom and personal responsibility.

Let me take a different tack and discuss driving:
You are certainly capable of driving your car across the center median
and directly into the path of oncoming traffic. We have laws which
state that you shall not do this, but it happens periodically. I see
radios as the same thing. I can do it, it is against the law... I
choose not to. Capability is not against the law... use is.

Can we please get back to the regularily scheduled program of technical
discussions, mods and code wars, now?

Anybody who would put a transmitter in their house (baby monitors), cordless phones, or use cellular, should realize that they are "transmitting".

IMHO if "their" transmissions are in "my" air then they are "mine".

Anytime I wish converse, privately, with someone I do it over the phone, not over the radio (of any type). Even the police [;-)] are smart enough to do this.

If sombody were to walk outside naked it would be silly of them to protest the glances of a passerby as an invasion of their privacy. The same goes for anybody who uses transmitters indescriminately. I have no sympathy for them.

Isn't it interesting that is basically what saved the hobby in the 1910's?
The government and military, particularly the Navy, had enough clout to
keep us from losing it to commercial interests. As it was, the hobby
was *intended* to be torpedoed by relegating it to "useless" frequencies.
That time the hams didn't totally buy the argument. I'm beginning to wonder
if this time we haven't.
The first time propagation saved us. This time directed beams *could* but
the commercial interests already know the spectrum's value and we amateurs
don't appear to.

I thought it might be of general interest to many of you if I made the announcement of a new Conference - The Microwave and RF Forum. Accessable directly from RES-Q (tm) (201) 881-7421.

(Also available as Group Mail from 9:100/9 & 9:833/7 as MW_RF)

MW_RF is made available by Compact Software, Inc. soley for the purpose of furthering knowledge within the Microwave and RF community, [and my assurance

of no commercialism].

CSI designs CAD/CAE software for all phases of design and development, so there
are many engineers here who would enjoy the opportunity to participate in roundtables and such...

If you are interested in bringing a forum such as this to it's feet, ask your

local SysOp to obtain the Microwave and RF Forum.

Bill Kreps, SysOp of RES-Q (tm)

[start of biennial flame]- MTK

> Aye, there's the rub, those last 5 words. The out-of-band
>transmissions, no matter how well-intentioned, are still illegal.

This may be true (or it may not, depending on whether you think an FCC regulation has the same force as a LAW passed by congress).
HOWEVER -- if you are not an employee of the FCC or a Federal law enforcement officer would you please either answer the question (how to modify for out-of band) or be quiet. If I want instruction on correct moral behaviour I can watch any number of TV preachers.

> It is not unreasonable to interpret ownership as intent to use.
>If you can't use it, why go to all the trouble/expense of owning it in
>the first place?

My car is capable of speeds well in excess of 55 mph (in fact, in excess of 120 mph). I suppose by your argument I should sell it (WHAT? to someone who might break the law with it?) and buy a Yugo.

> I don't really care what the next ham does with his equipment,

Yes, you do. Or you wouldn't have gone on so long with your postings.

>or who supports the manufacturers with their purchasing dollars. I do
>care that some jerk is going to modify his HT "because there are no
>rules saying I can't" and abuse the privilege to the detriment of the
>rest of us hams. "Ham operators" are accused by the press of causing
>all sorts of havoc, from interfering with airplanes (when an illegal
>CBer was the culprit) to wrecking TV reception to illegally
>eavesdropping on cellular phone calls (everyone with a radio must be a
>ham). Why invite such bad press by actually possessing equipment
>capable of illegal operation?

Is that ever a non-sequitur. First you complain that hams suffer bad press because of what NON-hams do, then you suggest that the remedy for this is for HAMS to not modify their equipment. Show us that this is a real fear by citing cases where Hams have invited bad press by possessing equipment capable of out-of-band operation -- with the singular exception of CB kilowatts.

I have received a number of irate responses presuming that I MUST have taken
a position when I asked whether we really need all the ham microwave bandwidth.
I viewed it as a way of drawing out positive responses, and making people
think over what should be promoted, and EVEN to shame people into getting on
these bands.

One of the flaws I'e noted in ham microwave activity is that there is way below
a critical mass of users. Some people spend so much time "getting on" the
various bands that they never actually operate. This makes me think that we
either need lots more people interested in microwaves, or fewer bands :-(.
What activity can attract enough people to get a critical mass? It is surely
a chicken-and-egg problem, but even we on these nets (who seem to talk a lot
more than actually DO anything) can focus on something that will:
work
be useful
get someone to market kits or gear
be reasonably economical
....

Or can we?

Hmmm ... my Santec has a varactor tuned preselector on the front-end.
I've never experienced intermod problems (even on some crowded hilltops).

/ hpfcso:rec.ham-radio / sehrlich@lynx.northeastern.edu / 2:27 pm Oct 14, 1990 /
While I am waiting for my Technician license from the FCC and US Snail,
I was wondering if there is any type of HF antenna for indoor use to
overcome the problems of living in an apartment? I have full access to
the equipment at my University's club, but was still wondering if there
was any type of decent indoor antenna for HF use?

Thanks.

Scott

(sehrlich@lynx.northeastern.edu)

Congratulations on your new license!

No. There is no "decent" indoor antenna for HF use. Any indoor antenna breaks
the cardinal rules of antenna building - keep it as high as possible and in
the clear. But don't dispair, there are many usable antennas for your situation.

First, look around and see what you have access to. Any large (and long) metal
object may be used. A wire from a tuner to a window sill, bed frame or
(if possible) the outside downspout will make an antenna. Try anything metal
you can find. If there's nothing metal, try using a single wire from the
tuner. Make it as long as possible and as high as possible.

Real antennas will (sorta) work in an apartment. A dipole on 10 meters is
only 16 feet long and should fit in any room. Don't worry about bending the
ends to make it fit. My favorite antenna is a full wave loop. It's a 1/4
wave on each side and fed through a 1/4 wave matching section of 75 ohm coax.
Since most rooms are square - a square antenna may fit nicely around the
ceiling. Just pick the frequency that matches the room. 16 feet on a side for
20mtrs, 11 feet for 15 mtrs and 8 feet for 10 mtrs. (These numbers are
estimates - see a ARRL handbook for the equations.) Since I run QRP (low power)
I can use 22 gauge bus wire available from Radio Shack. It's cheap and
nearly invisible. If you're running high power you'll probably want to use
insulated wire to keep from giving the cat RF burns.

Lastly, don't forget the ground. If you're lucky you may have solid copper
cold water pipe which can be used. NEVER use gas pipe! I wouldn't admit in
public to using the ground screw on a 3 wire outlet but I might mention in
private Email that it's better than nothing.

I'm often amazed with what can be done with low power and marginal antennas.
I've answered stations calling CQ knowing "he can't possibly hear me
since my antenna sucks and I've only got 5 watts" and then end up with a nice
QSO.

Good Luck. Let us what you decide to put up and how it works.

Bill - WA7NWP

p.s. I'm finally in a house with room outside for antennas. Every weekend my landlord is gone - I put up a new antenna.

2078. Radar detectors

Radar detector owners may be happy to note that the efforts of an auto insurance company to deny coverage to owners of car radar detectors was defeated in California. The Radio Association Defending Airwave Rights Inc. (RADAR) was joined by the California State Department of Insurance and the Independent Insurance Brokers Association in defeating GEICO, the insurance company who wanted to deny coverage. The case was before the California Insurance Commission. There was no indication if GEICO planned to appeal the decision.

Provided it is certified properly. There is more to certification than
type acceptace. Transmitting out-of-ham-band with ham gear is not
illegal, just because it is out-of-band with ham gear. I have 4 pieces of
gear I use, almost exclusively, out-of-band, and all 4 are legal.

> If you can't use it, why go to all the trouble/expense of owning it in
> the first place?

Unfortunately, the out-of-band mods don't limit what out-of-band may
be used. The HF rig I have has the out-of-band mod (a switch) which
allows 100kHz to 30MHz xmit, even though I need only one frequency. In
this case, it is quite unreasonable to interpret my ownership of this
radio which may transmit on 5696 kHz as intent to transmit on 5696. I
went to the trouble/expense of ownership for legal use, the rest just
fell out because it was cheaper for Yaesu to allow all than some.

Would you also paint the person who just passed his exam and buys his
first rig at the same hamfest as doing something illegal? He has no
license yet, but has ownership of something he can't use. Yet. This must
be intent to use, so he is illegal.

> rest of us hams.

Ok, too. But this contradicts the previous quote. Modifying an HT is an easy way into illegal activity, but it wouldn't take too long to build, from scratch, a radio that would screw up the local police. The circuitry in my HR-12 is pretty trivial. Forbidding HT mods just because the HT might be used for wrong purposes is like closing the front door but leaving the windows open in winter and expecting to keep warm.

> eavesdropping on cellular phone calls (everyone with a radio must be a
> ham). Why invite such bad press by actually possessing equipment
> capable of illegal operation?
>
In case you haven't noticed, the press will report what it wants, despite what reality is. This is no reason for us to throw away anything we own, just because it might be used for illegal purposes. If we fell into that faulty logic trap, we would need to throw away all radios that transmit (they are all capable of malicious interference -- illegal), many TV's (do you have one that receives cellular freq's?), computers (heaven forbid, I might break into a network with one), printers (to print forged documents), automobiles (I might drive to the liquor store to hold it up), and books (usable as a weapon in an assault.) Alligator clips (errr, roach clips), screwdrivers, empty bottles, the list of items that would assist illegal activities is endless.

None of the equipment I own has caused bad press, nor invited it. I am not sure how they would even know I had it, unless they read this newsgroup. Since it is not used for illegal activity, there is no bad press possible. And what do you think the press would report if the original poster uses his equipment while on a fire call and saves 2 lives? "Fireman uses illegal equipment" or "Fireman saves 2"? I know what slant I would use if I were a reporter and discovered non-certified equipment in use: "City too cheap to properly outfit firemen." How likely would I be to find that last one out? Not very. The use of personally owned equipment just isn't that big a deal.

This is my signature. It doesn't contain my name at all!

Some of the comments relating to spectrum usage bring to mind the work I was involved with before I started working on my (current) thesis topic. Check out my paper in the 7th ARRL Networking Conference.

In particular, there is a strong need for a "spectrum efficiency" quotient which could be applied to a particular service requesting spectrum. The need for this sort of quantification is pretty well demonstrated by tradeoff between multiaccess ("packet radio") and monoaccess networks; compared to link type monoaccess networks, packet radio is very inefficient spectrally at microwave frequencies.

It's also worth noting that you can build really cheap (<$1000) DS0 ground stations for a geosync satellite, when using L and C band links.

This is just to confirm that the modification that was posted to the Alinco DR110T also works on the DR112T (same radio, but with an LCD display as opposed to the DR110T's LED display). Pop the cover, cut one wire, reset the radio, and PRESTO! Instant expanded coverage.

I verified that the radio will receive the National Weather Service. However, I haven't tried listening to the 300 MHz or 800 MHz segments the radio now covers. I have no idea how well (or how poorly) the receiver performs at those frequencies.

Strike a blow for Ham Radio.... write letters.

In the September issue of OFF-ROAD magazine, they published pictures
of a tricked-out truck that included a CB amplifier.

I wrote the magazine a letter which they published in its entirety
in the November issue which explains some things about CB amps, hams, and
reliable emergency communications.

Also, interestingly, my father, also Ron Miller, got a letter published
in the same issue. His letter was about gas mileage.

The word processor is a mighty instrument!

I have two BAUDOT teletypes that I need to get rid of. As opposed to sending them to the scrap yard, I would like to see them go to someone who wants them.

I haven't messed with them for 8 years, but I think one is a Model 13 orr 15, and the other is a model 19, (w/paper tape punch). I also have a paper tape reader that goes with the Model 19, and a stack of manuals from American Teletype Corp.

Comments, tips on disposal, etc. will be greatly appreciated. My dad wants the ccorner of the garage back, and he is giving me until christmas to get rid of these things myself...

Message-ID: <6088@videovax.tv.tek.com>
Source record: 7697

I had a problem with my TH-25AT overloading anytime I connected it to an external antenna. The S-meter would read full scale *all the time*. I was able to subjectively improve its sensitivity by putting a 10db pad between the HT and the antenna. This apparently reduced the level at the first mixer enough to eliminate most of the intermod. Kinda seems counter-intuitive that adding attenuation would make it easier to copy weak signals, but science is that way sometimes...

Of course this also attenuates the transmitter by 10db, but I can still hit the repeater ok, so what the heck.

> What grade of service does everyone else get that allows 9-1-1 callers
> to DICTATE to the PSAP what goes into the ALI database?

First of all, we are NOT dictating what goes into the ALI database.

> Problem: When dialing 9-1-1 from the repeater autopatch, the repeater
> location shows up on the screen at the 9-1-1 center, which could
> POSSIBLY (not likely) confuse the operator.

Agreed. This can be a potential problem. The information is, though,
generally useless, so there is not point in putting it up. However the
computers are capable of associating other general data with any phone
number. The phone company provides the information it has, but the 911
system administration can add whatever they want (that they have disk
space for).

> The solution is to eliminate the ALI (Automatic Location Identification).

Better yet, for these phone numbers, REPLACE the normal ALI information with
special instructions. Those instructions could read:

This call originates from an amateur radio repeater.

Use simple radio protocol; this is not cellular.

ALI data would not be applicable for mobile stations.

> So our repeater group programs the repeater controller so that it dials
> a 7 digit number that comes in on the same 9-1-1 lines, but with no
> ALI.

That's better than giving the dispatcher potentially misleading data.

> The solution works, and everyone is happy.

Are they REALLY happy. Do the 911 system administration people really
know you are doing this? These are the people who did not respond, right?

> Now Mr. Stark Raving Ham is PISSED OFF, because....well, no one's
> really sure WHY he's upset...he just usually is.
>
> This guy actually sent me mail, saying he USED to think Seattle
> was an OK place before he read rec.ham-radio and found out what
> a LOUSY 9-1-1 system it has!

NO!! *I* was the one that sent you that mail.

And I did NOT say it had a lousy 911 system, I said it was mismanaged.
You responded by e-mail saying I was upset because they did not do it MY WAY.

But this is not correct. I believe that system is mismanaged because your inquiry concerning the ALI database was NOT RESPONDED TO.

Had they responded, and declined to change the database, then at least they were in a position to know what was going on and decide what best fits into their system. What they did instead was choose to keep themselves ignorant and encourage you to do what you felt best to improve the situation. I do NOT disagree with what you did. But I believe the central administration problems go beyond simply making decision that happen to be different than you or I would have made.

> I'm sure glad he's not in our repeater group. I can just see him
> calling the media when things don't go his way.

It's not a case of it not being "my way". I don't call the media for that reason. I call the media when something is definitely wrong and the normal channels of clearing it up fail to do so after a reasonable degree of effort. We call it "whistle blowing".

I'm glad you don't run the media.

You're not just whistling Dixie! ;-)

> What if the guy wants to do repeater offsets to operate on RCC
> frequencies in an emergency, to telephone (via radio) the police?

Good question. If you're gonna do that, wouldn't it be easier
just to set up the radio on a simplex Public Safety frequency and call
the dispatcher direct? Ma Bell may actually take an even dimmer view
of unauthorized transmitters on her channels because you would be
costing her some revenue.
Any RCC/IMTS experts on here? Does the telco equipment allow
"unregistered" mobiles with no phone number assigned to place calls
through the mobile phone equipment? Maybe the idea of using RCC
channels in an emergency is technically unfeasible.

I don't know how widespread the problem really is, but in the
communities surrounding me there is a serious shortage of volunteers.
This creates a "seller's market" for volunteer services and the people
who volunteer can (and some do) say "you can't make me do that or I
won't volunteer any more." We're talking about fire and EMS personnel
here, so mandated minimum standards are appropriate.

> it is not a loophole.

In the strictest sense, no it is not a loophole. I also will
not deny the existence of rules that cover the situation. But I know
hams who do not have the judgment or self-discipline NOT to transmit
where they don't belong. They should not have the capability.

I see. I guess what I was thinking of is more along the lines
of "auxiliary" operation, which (I think) must be done on a different
band from the main transmission. There are restrictions in the rules
as to who may engage in auxiliary operation.

The way I approach problems, projects, and such (greatly based on my experience as a systems programmer) is the modular approach.

I don't want to be a complete appliance operator, but for the time being that is what I am, and it is between 144 MHz and 450 MHz.

I don't care to design and build circuits at the discrete level, either, at least not yet.

What I would like to see on the market are modular building blocks of complete modules that can be used to operate on VHF/UHF/SHF/EHF bands. A transverter, and some of the subcomponents of transverters, are now on the market, and these constitute are partial solution.

Additional modules are still needed. There need to be modulator modules to get your voice, data, or video, into an emission mode of one type or another. Modules of different emission types should all output the same I.F. frequency at the same power level.

Mixer modules (some are available now) would allow converting the signal up or down as desired. Modules should be available for output or input for every ham band that they can be made for. The power levels should also be consistent. It may be necessary that a different line be used for receive and transmit applications (due to power levels, etc.).

The modules should be as small as practical, totally sealed the best possible, or such totally sealing be available. Some should also be designed for outdoor use, or at least make a system container that can be (even with a heater).

Connector types should be consistent for a given frequency range.
My personal opinion rules out UHF/SO239/PL259 type connectors above
30 MHz. BNC should not be used above 1300 MHz and 450 MHz might be
a more practical limit. Up to 3500 MHz the TNC can be used. The N
connectors are good for a wide range. SMA are also very good to use,
but are not needed below 900 MHz. I'd be quite happy with N from
50 MHz to 5925 MHz.

PA modules should be made for a range of power levels. There are plenty
on the market now for up to 450 MHz. Higher ranges are needed.

Antennas need to be marketed for those of us with no machine shops.
I'd like to see some commerical yagi, helical and/or parbolic dish
antennas for all the microwave ham bands. For bands that can use
waveguide feeds, such antennas should be made as well as PA units
that can be directly attached.

I guess that's asking too much.

QSY-ing back down to VHF/UHF.

> label of "emergency" in non-emergency situations.

I'll take Door #2, Monty. Yes, there are operators who will and
do transmit with their ham equipment on non-ham frequencies during non
emergency situations. Some of them are chatting with their friends
who are legitimate users of the service on commercial gear.

> There are levels of "emergency" involved here. Passing health and welfare
> traffic in and out of an disaster area would count as a low level of emergency
> and is well within what the B&P rules are about. These are the things we do
> *AS* hams.

I don't see RACES' function as H&W traffic handler. I was
referring to actual emergency "tactical" traffic in direct support of
Public Safety and relief agencies. Even when working with the fire
department, we don't transmit on fire frequencies AS HAMS. They can
certainly provide us with fire portables if they feel it's necessary.
They can also provide CBers, other volunteers and the average person
in the street who doesn't know what a PTT is with a radio if they so
desire.
Usually, however, the served agencies do not want the ham
communicators on their agency channels.

> *NOT* because I am a ham; I'd do it if I was not a ham. The
> radio happens
> to be there because I am a ham. I would also cite amateur rules after the
> fact when responding to agencies about the matter.

You might have less trouble with the FCC if you cited the other emergency rules and left Part 97 out of it. I would rather say that I used an available police radio as a concerned citizen than as a ham transmitting out of band.
That is only my opinion, however. I am not a communications lawyer or FCC investigator. It might be an interesting question to pose to someone who is.

> I've read both positions, and it still seems to me that you are not
> exactly arguing the same points. This is usually when discussion and
> debate turn into arguments and flame.

Having looked over the entire thread, including your comments, I suspect that you (and Jay) may be right about that. Perhaps if Jay feels up to continuing this discussion a bit further, he might be persuaded to enumerate the issues that are pertinent. That might focus the discussion a bit better.

I got to watch my colleagues deal with the Morris Internet Worm incident (while I was monitoring Bitnet closely at the time before we knew what was really happening). I also read the newspaper and watched the TV about the situation. The media just got SO MANY things ABSOLUTELY WRONG or at best GROSSLY OUT OF CONTEXT. I do believe much of it was due to their neglect and ignorance, and their urge to get the story out before double and triple checking their understanding of what is told to them.

There have been a few cases where I get to see the media deal with an issue I know a lot about. ABSOLUTELY EVERY time, they got things wrong and/or out of context.

From that day on, I have always questioned what I read, hear, or see, in the media.

There have been a few exceptions. I generally found the Christian Science Monitor and the Wall Street Journal to be both more accurate and quite thorough at times. I just wish the Christian Science Monitor was back in the form that they earned their reputation.

> By the way I support the no code licence as long as the CW bands don't change
> so that we can still have our kind of fun. [a possibly lame attempt to quell
> a flamefest :-)]

THIS supporter of a no code license ALSO supports the idea of people
choosing to learn Morse Code and use it. I just believe it should be
by choice, that's all.

I also agree that 5 WPM code is boring, as would be 5 WPM voice (try it).

You have not given code a chance to prove itself as being interesting
and fun until you have learned it at a high enough speed to really do
some communicating. Try for 25 to 30 WPM.

Hello.

I'm posting to these groups. Not really sure where else this
should go.

I'm interested in solar electricity generation. My slightly
ambitious idea is to reduce the amount of power I use from the power
company. Much electronic equipment exists that runs very well on 12V DC.
Most of it is for cars and RVs. The necessary 12V DC can be obtained
from car and trailer battery systems. The occasional 60 Hz house
current used in North America can be pulled from the odd 12V DC to
110V-125V power inverter. Lower voltages can be had using NiCad
batteries. What I need is a way of recharging the batteries. This would
require high output solar panels, voltage regulators, and circuitry to
avoid over charging of the various battery systems.

What I need is pointers to any manufacturers that might produce any
of the equipment I need. I've been poking through the latest yuppie
catalog from Edmund Scientific. They have some of the kind of thing
I'm looking for but unfortunately they don't include any information of
who makes what.

Any manufacturer info like names, addresses, phone or Fax numbers
etc much appreciated. Please send any responses to my e-mail address as
I'm not on any of these lists with regularity. My e-mail address is

johnson@northeastern.edu

Thanks much.

2103. HELP - PK-232 "Warbling" modulation of my HF TS-440S rig

Newsgroup: rec.ham-radio
Date: 1990-10-17 08:59:49 UTC
From: gary@ellis.uchicago.edu
Message-ID: <1990Oct17.085949.3407@midway.uchicago.edu>
Source record: 7713
Cross-posted to: rec.ham-radio,rec.ham-radio.packet

Dear net people....

Hopefully, someone can come to my rescue with problem/query.

I've been on VHF packet for a while now... using a Kenwood 731A,
PK232 and a Mac. All is well.

I decided to try some HF packet, RTTY, AMTOR and the like with my
TS-440S. The kenwood 731A and the 440S have identical Mic jack
connections. So, my already constructed mic<-->PK-232 cable should
work fine - right ?

For HF the PK-232 manual says to put the HF rig in LSB/SSB mode,
apply the tones to the Mic jack (as I do in the case of VHF/Packet),
enter CALibrate mode on the pk-232 and adjust the Mic-gain on the
HF rig for an on-scale ALC reading.

Simple enough. But, something appears very wrong in that I get a
very erratic reading on the ALC meter. I would assume that a
pure tone as is being generated by the pk-232 (mark or space) would
produce a stable ALC meter reading. I did all this through a dummy
load (of course) and also see that the power out (watts) is very
erratic - following the ALC meter reading.

If I had to guess it would seem that the pk-232 is over-driving the
Mic input to the point of distortion. But, there is no adjustment of
the AFSK output level that I make that gets rid of this erratic
ALC meter reading.

Again, the VHF packet works fine. I can monitor solid tones in
CALibrate mode. No problem with the drive level on the FM rig and
I would assume that I can use the same drive level for HF as I do
for VHF/FM packet (as this adjustment is critical for FM). That is,
get the pk-232 AFSK drive level set for FM/packet then use the Mic
gain control for when I switch to HF/SSB.

Whew. How can something so simple get so complicated.

Plenty of people out there must have TS-440S rigs (successfully) hooked
up to PK-232s.

So, whats the story on these erratic "warbling" ALC meter readings when
in PK-232 CALibrate mode ??? Not normal right ?

I know I should be using the ACC 2 jack on the Kenwood rig. And, I
am having a cable made according to the specs in the pk-232 appendix
for kenwood radios (so I hope their right about the connections).

In any case, the Mic input should work. And it will be just my (bad) luck that when using the ACC 2 jack I get the same thing.

Anyone got an insight into these erratic ALC readings I'm seeing ?

Thanks
Gary

>Thanks in advance, I suggest posting responses if of likely wide
>interest.

I have used the Cushcraft and KLM antennas. The KLM antennas are much
better and much more expensive. The Cushcraft antennas simply do not
work right when they are wet. Even a heavy dew seems to detune them.
The KLM antennas are very nicely built and work fine even with a light
coat of ice on them. I haven't used the Hygain antennas, but a friend of
mine is impressed with them. The U110 will barely swing the Cushcraft
antennas if you balance them carefully. The KLMs are too long and heavy
for the U110 to handle reliably. I used the Kenpro KR500 until recently
when I changed to the dual axis 5400b system from Yaesu/Kenpro. I swing
a KLM22C, a KLM40CX, and a pair of loop yagis from Down East Microwave
for 1.2 and 2 Ghz. You really do want the ability to switch polarization
from the operating point since apparent polarization changes during an
orbital pass due to the changing geometry of the path. Make sure your
feedlines exit the rear of the beams and swings free down to your
preamp box. Routing the feedline along the boom to the mast will disrupt
the antenna's pattern and make it difficult to boresight more than one
antenna to the same point in the sky.

>> frequencies in an emergency, to telephone (via radio) the police?
> Any RCC/IMTS experts on here? Does the telco equipment allow
>"unregistered" mobiles with no phone number assigned to place calls

IMTS is a type of AFSK system and does not use Touchtones. The mobiles all park on a channel marked with idle tone. When a mobile goes off-hook a handshake with guard tone, connect tone and seize tone takes place. Idle tone moves to another channel and the idle mobiles follow it. The mobile then outpulses its ANI with connect tone at 20 PPS. Pulses of guard tone are sent after certain bits as a parity check for the ANI. After getting dial tone, dialing is accomplished by outpulsing connect tone with guard tone on off normal. The disconnect burst contains disconnect and guard tones.

RCC systems often use a system called SECODE. It's similar to IMTS but not compatible. Both systems have stringent timing requirements and require full duplex operation. There are more system variations than you can shake a stick at. At the bottom rung are SMR operators that use interconnects similar to autopatches. Each user is identified by a different PL tone. I think maybe the full-duplex systems are harder to dink around with than you may have thought. All of this info is published.

Here's some food for thought.. fire departments and ambulance crews
deal with emergencies all the time. Their purpose is dealing with
emergencies. Emergencies are routine. Does that mean they can
routinely use ham frequencies & repeaters without even a ham
license? The rules say no, but HEY! its an emergency!

2112. Antenna Restrictions

Newsgroup: rec.ham-radio
Date: 1990-10-17 20:46:46 UTC
From: randall@informix.com
Message-ID: <1990Oct17.204646.19836@informix.com>
Source record: 7722

Some interesting issues have been brought up on the net recently about antenna restrictions. Now that fewer and fewer people own their own homes, and that most of these new homes are condos and townhouses, amateur radio is increasingly threatened with anti-ham rules from CC&Rs and city ordinances. These include antenna restrictions and even rules prohibiting radio transmitters.

I have a couple of questions for those of you out there who have experience in this area:

1. I have heard that recently all city ordinances involving TVI were declared unconstitutional, as this is the exclusive juristiction of the FCC. Can an apartment complex or homeowners association ban the use of ham radio transmitters?

2. Can homeowners associations ban antennas, or place height restrictions on antennas? Can city governments go the same? I assume that height restrictions are OK.

3. What can hams do to fight against such rules?

>"expectation of privacy" is likely to become a non-negotiable demand, and
>since there are several hundred million more of them than there are of us,
>guess who is going to lose - REAL QUICK!!!

This is another example of how new technology forces us to re-think our constitutional rights. There are very good arguments on both sides. The last I heard, the ACLU was siding with those who want restrictions placed on scanners, a position that surprised me. The "rights" of cordless phone users are clearly at odds with the "rights" of scanner enthusiasts.

My opinion is that everyone does indeed have a "personal space" which must be protected. HOWEVER, when you transmit a radio signal, you are sending that signal well beyond your "personal space." If your RF signal goes into MY "personal space", then I have the right to monitor it. To deny me that right is to invade MY privacy. I don't have the right to break into someone's home and listen to their phone conversations, but I should have the right to receive a signal that they are transmitting into MY home.

Think about it ... If monitoring cordless phones is illegal, then what we are saying is that the cordless phone user "owns" the signal. If he "owns" the signal, then he in fact "owns" a part of my "personal space", since his signal is there. I just don't like that idea. If the signal is in MY home, in MY room, surrounding MY body, then I should "own" it. Restricting radio receivers based on the "privacy" argument would establish a dangerous legal precedent that in the long run would harm our privacy rights. The public needs to be educated on this issue, and an un-biased report from CBS is a good place to start.

It should be noted that authoritarian regimes tend to place restrictions on radio receivers. It's pretty dangerous to have all that free-thought being picked up by the masses. Laws against radio receivers are censorship, plain and simple.

The SOLUTION to this problem is NOT to outlaw scanners. The solution is to digitally encrypt the signal, just like some police departments are doing. I know that this would increase the cost of cordless phones, but this is the only real way of guaranteeing the privacy of conversions on them. Even if scanners are made illegal, a clever kid could always

modify his Radio Shack 49 MHz walkie-talkie to pick up baby monitors.

A local ham (without net access) is in need of a schematic for a radio
sold by Montgomery Ward (sp?) as the "Airline TRF". All I know about the
radio is that it uses 201A's.

Send all replies via e-mail. Thanx in advance.

>
Well said Phil.

If I remember right, below 15 WPM I felt that I was in the
early part of a learning curve. At that stage you have no idea what it will
be like later on when you are "fluent" in the new language you are learning.
Almost all of your effort is spent just getting the right sounds out and
correcting mistakes. At this stage you are completely dependant on writing
down letter by letter everything you hear. A most painful stage where you have
to have "faith" that it will all be worth the effort.

At about 15 WPM I began to feel "competent" in my new language. I could think
more about what I wanted to say and less about the mind/hand coordination
necessary to communicate. I could now have a reasonable conversation with
someone in an acceptable amount of time. At this stage, also, I felt that I
knew what it was going to be like when the whole process became automatic:
the stage of fluency. Here it begins to be "fun" and more spontaneous and
less faith is needed to continue. At this stage, however I was still dependant
on writing down on paper much of what I was copying but I began to read by
ear many of the most common words and could see that doing away with the pencil
completely was going to be the final breakthrough.

That breakthrough happend at about 20 WPM and it seemed to come quickly. I
think it took only a month or so to go from 15 to 20 WPM. I think this stage
comes more quickly because you have the all the basic mind/hand reflexes in
place at 15 WPM and getting faster is now a matter of "burning in" what is
already there. All of a sudden I could copy everything in my head and remember
it all well enough to "converse" back and forth with someone in a real exchange.
At this point the key (iambic) is a joy to use and becomes an extension
of your mind as you push out what you want to say with fluid hand motions.

At that point I thought I was a real CW "hot-dogger" and had nothing more to
learn so I was surprised to find that at about 30 WPM there was another
stage. Here the key seems to disappear and you really "talk" in a new language.
Now there is no difference to me whether I work SSB or CW. Often I can't
remember whether a QSO I had last night with someone was on the mic or the key.
I have to look in the log. Here you flip between modes without thinking about
it and it dosen't really matter.

I would say that this is really the stage of fluency but now I wonder if there
is another stage at 40 WPM.......50 WPM......Ah another frontier.

I wonder what it's like to play chess with a 2800 rating? Only Gary knows....

Yes it could, unless the ALI was modified (I've seen it done - I
have worked in a real, live E9-1-1 PSAP myself) and the operators were
properly trained.

> The solution is to eliminate the ALI (Automatic Location
> Identification).

Wrong. The solution is to IMPROVE the ALI.

Go read the Basis and Purpose of Amateur Radio at the beginning
of Part 97 again. Among other things, it mentions "self-policing."
You are requesting assistance to commit what may be an illegal act. I
am advising you of same, in accordance with one of the many
requirements of the amateur radio service per FCC rules. End of
fight.

Perhaps another issue has crept in here that obscures the
original argument. Do you transmit "out-of-band" as a ham or as an
authorized member of an agency with operating authority on those
frequencies? (I am assuming that, as you state, the equipment itself
is legal re certification.)
If you transmit on frequencies allocated to another service as a
member of that service, then Part 97 does not apply to your
communications at all. You are then bound by the applicable regs for
the service you are using and the general regs for all radio users.
The fact that you also happen to be licensed under Part 97 as an
individual is immaterial.
In my *opinion* this is different from the case of a ham who
takes his HT, which is only certificated for amateur use, and modifies
it for out of band coverage for whatever reason. If he can get the
radio certified/type accepted/whatever by the FCC for the additional
frequency coverage, the radio itself is legal. Then all he needs is a
license in the appropriate other radio service OR authorization from a
licensee to transmit under their license. That takes him completely
out of Part 97.
Remember that this whole thing got started by somebody who
stated he was trying to access non-ham repeaters with ham equipment
and wanted advice on how to attain the odd split. Nothing in the
message offered any evidence of type acceptance for his radio to go
outside the ham bands, nor did he mention any authorization or
licensure for non-ham transmission. If properly licensed outside of
the amateur service, he could have simply contacted a service shop or
the manufacturer for this info. Even if he simply preferred to ask
fellow hams for advice, mentioning the above might have made life
easier.
The beginning of Part 97 (Basis and Purpose) mentions "self
policing" as one of the traits of the amateur service. I don't think

any of us take that to mean playing radio cop with each other. I do believe that it obligates us to at least try to keep each other out of trouble.

I think that one has already been addressed. It comes under
"serving the regular business interests" of the agency, or similar
wording. In other words, we can't dispatch police cars on 440. That
is the routine operation of the PD and does not really constitute
"emergency" operation.
Perhaps we can turn up some documentation on when this issue was
discussed and what the current interpretation really is.
As far as the "without a ham license" part, that is covered in
the rules for THEIR services (Part 90) and would constitute unlawful
"out of band" operation on their part.

This is not true. The Civil Air Patrol frequencies are MILITARY (Air Force) frequencies and thus are not governed by the FCC.

It is legal to use non type accepted equipment on MARS and CAP frequencies. It is NOT legal to use non type accepted equipment on public service and commercial frequencies.

On a slightly different subject, I have not entered this flame-war on calling dispatchers on a ham HT on purpose, because it has mostly been beat to death.

I personnally call our county dispatch quite often. I am a member of a recognized volunteer emergency group, have an assigned public service call, and have public service radio training. But, when I do call dispatch, I DO IT ON A TYPE ACCEPTED RADIO. Type accepted handhelds generally cost a little more than the equivalent ham stuff but are getting cheaper all the time. I can buy a KING mobile for not much more than a ham mobile, it will cover from 144-174 Mhz, has a REAL scanner, and a REAL priority, and does not suffer from intermod.

Regardless, If I were caught somewhere with a REAL emergency, without my type accepted equipment, outside of my recognized jurisdiction, and couldn't get anyone on the ham bands, would not hesitate to call the nearest dispatcher on my modified HT. BUT...that's a LOT of IF's don't you think?

> How important is a remote control left/right handed polarization switch,
> and which packages include this?
I can't answer for the current crop of satellites, but I know that on Oscar's 7, 8 and 10 it made a difference. The Polar orbit jobs flipped about and a polarity switch was nice. KLM sells a polarity switcher, but the best deal is the polarity switching box described in the RSGB VHF manual - it also used to be sold by the VHF Communications mag people and J-Beam. This box lets you switch between RHC, LHC, Vertical, Horizontal, 45 deg slant and 135 deg slant. The box is manually switched in the shack and you need 2 coaxes from the antenna. I used this switch box extensively on Oscar 10. There were times when the best signal was slant polarisation. So, I suggest you make a switcher as per the VHF manual for best results and use the KLM LHC/RHC switch as a second choice. As I recall Crossed Yagis are made by J-Beam, Cushcraft and KLM, there may be others.

> Any views on the practicality of using an Alliance 110 rotor for
> elevation? (I have a heavy duty rotator already for azimuth).
I have used this setup. It works, I prefer the old Stolle rotators to the U-110. The Stolle has been sold as a J-Beam, RCA and Radio Shack. They had a bit more poke than the U-110. I havent seen a new Stolle since 1977, they do turn up at swap meets. There is a modification for the U-110 using selsyns as indicators in the September 1979 QST. Fair Radio Sales may even still have the parts.

My final note is the "Non Conductive Crossboom" question. PVC plumbing lacks rigidity as do many fiberglass poles. If you can get old pole vault poles they are nice. My best bet is a regular closet pole from the local lumber yard. Test them all to find the one with least flex. Use polyurathane varnish on the pole.

Lotsa luck. Maybe one day I will get an estanzia and put up more antennas.

You only need to identify YOUR signal. That the ID usually is heard on
the repeater output serves only to identify you to those listening to the
repeater and do nothing to identify YOUR signal. Therefore, IDing when you have
dropped out of the repeater should be done on the same frequency tha YOU have
been using, the repeater input.

ID your station on the input frequency. The fact that you are no longer readable on the repeater is not relevant; you should identify on the frequency which your station was transmitting. The same holds true on HF; if the station you are communicating with can't hear you any more, you still have to ID when you are finished.

If you are no longer readable then just say something like "WN4BBJ clear," you will be covered.

One consideration is that the HW100 doesn't let you run split
frequency at all. If you send CQ and the other guy calls back outside
your narrow passband, you can't retune to copy him without changing
your transmit frequency as well.

Other than that, if I had to choose between 400 and 250, I would take 400
for ease of tuning, especially since you don't have the ssb width filter
to fall back on.

This is a classic case of RF feedback. Use standard RF suppression techniques such as RF chokes in the AF leads (toroids ok, put the suppression as close as possible to the mic connector) and .001 caps to ground at the mic connector. While you're at it, put suppression in the power lead to the TNC. Ground your TNC to your station ground. Undo that fancy cable lacing and seperate your cables.

Amen to that. when I moved from New York, I had a LORENZ LO15 in immaculate condition and enough spare parts to keep it running for years to come. I also had an American made ASCII Teletype. Not only could I not sell them, I also could not give them away. As a matter of fact, I couldn't even get my garbage contractor to haul them out for me. Someday, someone is going to be crawling around the eaves in the attic of the old house I used to live in and boy, are they going to get a surprise!! :-) :-)

Dan Meyer asks:
>If you are using a repeater, and you signal drops to the point of being
>unreadable to the repeater, how does one legally ID ? Just id on the input
>frequency ? just id on the output frequency?
> -- N0KFB

Presumably the person you were talking to knows who you were, so whether
your ID gets through the repeater is immaterial. You are supposed to ID
your transmitter. The repeater is supposed to ID itself, which it will
do whether you're making it in or not. So where's the confusion?

2133. "wireless lan" for 902-928Mhz

Newsgroup: rec.ham-radio
Date: 1990-10-18 15:35:36 UTC
From: cep@cci632.UUCP
Message-ID: <40999@cci632.UUCP>
Source record: 7543
Cross-posted to: rec.ham-radio,rec.ham-radio.packet

This article is partially reprinted without permission from the Sept. 24, 1990 "Electronic Engineering Times":

--
Dayton, Ohio - NCR Corp. has joined a small club of vendors seeking to sidestep the physical media debate in local area networks by proposing that users switch to a wireless LAN. At the recent NetWorld conference in Dallas, NCR introducted an interface card for "WaveLAN", a spread-spectrum RF LAN that uses an omnidirectional radio antenna in conjunction with a standard PC add-on card, providing LAN connectivity at 2Mbits/second.

[technical stuff deleted, incl. why infrared LAN's don't work -ed]

NCR has solved the security problem, at least in part, by offering encryption of LAN data using the Data Encryption Standard as an optional feature for WaveLAN. The signal, spread between frequencies of 902 and 928 MHz, provides additional security from interception. NCR has applied for eight patents associated with the wireless LAN technology. The IEEE 802 group of LAN committees has established a special working group, P802.11, to analyze wireless LAN standards, with which NCR is involved.

2134. CAUTION! Failed an exam?

Newsgroup: rec.ham-radio
Date: 1990-10-18 16:08:55 UTC
From: johnson@hpscdc.scd.hp.com
Message-ID: <5490104@hpscdc.scd.hp.com>
Source record: 7544

I took the Advanced test on October 14 and my exam answer sheet was scored showing five erroneous answers. Being well prepared for the exam, I asked to see the questions I missed as I found it hard to believe that I had five wrong answers. I only took the time to check three of the questions and found the following results. I marked one incorrectly (my own fault - I just missed it). In one case the answer key was marked incorrectly. I pointed it out to two of the examiners (both Extra class operators). They both looked it over and being non-technical types (answer memorizers), one agreed with me that the answer key was wrong, and the other guy couldn't handle the question at all. But they could do nothing as their hands were tied by the FCC rules and they recommended that I write letters to try to resolve the problem. In the third case, apparently the FCC rules had changed so both my marked answer and the examiner's answer key were incorrect.

My point is that if you fail an exam, don't take it lying down. Ask to see the questions you missed and make sure they really are wrong. It may very well be easier to take the exam again, after studying harder, than to try to challenge the results via a letter writing effort. But if more people complain about the clerical and technical errors present in the examination process, the more likely these problems will be corrected.

Good luck to you exam takers and fight if you know you're right!

Message-ID: <15780009@hprnd.rose.hp.com>
Source record: 7545

The following rumors have already been posted. Notes users should be able to find them by using the lower case x function and entering 77 as the search string.

Kenwood TH-77 & Bearcat 200XLT mods No responses
pvh@Apple.COM Pete Helme at Apple Computer Inc., Cupertino, CA

Anyone know if the new dual band Kenwood, the TH-77, is available in the U.S. or not yet. They're already importing the new smaller single band units (at least they've been advertising them).

Dear Pete Helme,

There is talk about bringing the TH-77 in the to US, but hold your breath for anytime soon.

Russ Black N6YFL

A call to Kenwood, 213-639-7140, yielded the following:

The TH-77 is a two band handheld. It will support cross band repeating. It will use all the current TH-25 accessories, e.g. batteries, chargers, except the cases. Advertisements should start showing up in November.

Suggested Price is $599.

Bill Thomas WB0ALN

I talked to the Kenwood rep at PACIFICON this past weekend. This is quoted from him (i.e., don't blame me):

The TH-77 will appear in the U.S. in about 4-5 months after FCC type accepting is completed. Price is unknown at present due to the current fluctuation of the Yen to the $. It will be packaged in a case something similar to the TH-26. It will use the same batteries as the TH-75/25/26 etc. It will support direct keyboard freq. entry, MR clear (a must for some). It is rumored to have dual 440 receive and it may do cross band repeat.

2136. Re: Household solar power, query.

Message-ID: <15780010@hprnd.rose.hp.com>
Source record: 7546

Edmund Scientific prices are a bit high.

Start with the recreational vehicle people and boating people for appliances that run off of 12 Volts (actually closer to 13 to 15 Volts). Check up on electric cars for information on what you can and cannot do with batteries and costs of batteries. Check also with farm and ranch suppiers for solar panels since some electric fences and water pumps are solar powered.

In general skip the energy conservationist sources who cater specifically to the Yuppie$ who want to maintain the appearance of socially correct lifestyle and check into those that cater to people who live or travel in remote areas and buy this stuff because they need to or because it is cheaper than the alternatives.

Before you start thinking that you are helping the environment, remember that battery chemicals, nickel, cadium, lead, sulfuric acid, and plastics as well as solar cell material and manufacturing process are not necessarily the best things either.

2137. J pole antenna plans for 2M

Newsgroup: rec.ham-radio

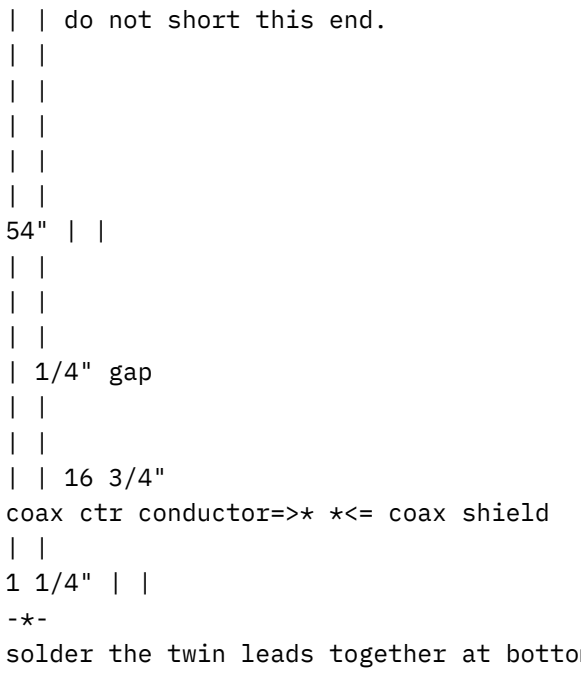
someone asked about J pole antennas, so from my files:

>From: kinsman@ektools.UUCP (Andrew A. Kinsman)
Newsgroups: rec.ham-radio
Organization: Eastman Kodak, Dept. 47, Rochester NY

The following is a description of a J-Pole antenna made from 300 ohm
TV twin-lead. Quite a few of the hams in the area have successfully
built one or more of these antennas. They have quite a few advantages
which include improved performance for 2-meter HTs, portability, and
last, but never least, they are inexpensive.



solder the twin leads together at bottom

1. Start with 54 1/2" of TV twin lead (foam core does not work as well)
2. Strip 1/2" of insulation at bottom and solder wires together.
3. Measure 1 1/4" from soldered wires and strip insulation on both
sides. This is the solder point for a coax feedline.
4. Measure 16 3/4" from bottom and cut out 1/4" notch on one side.
5. Feed with a length of RG58U coax. Tape coax at feedpoint to the
twin lead for strength and weather protection.

I have also attached an alligator clip to the plastic on the top of
the antenna in order to conveniently hang it. I am successfully using
one in my attic to avoid any CCNR problems. I have another that I can
take with me camping, sailing, etc.

This design has appeared on many BBSs and in club newsletters; the
earliest reference that I know of is a Jan. 1984 D.A.R.C. antenna
article by James Burks, KA5QYV.

Enjoy,
N6UBM

From: holly@hpcupt1.cup.hp.com
Message-ID: <7120135@hpcupt1.cup.hp.com>
Source record: 7548

Of course the real question is can you copy the code in your head,
have to write the letters down, or do you use the now disputed
method of writing out the dots and dash do decode at your leasure.
But wait!! Can the police dispatcher copy CODE?????? Do they have
to pass a code test for a third class license??? My dear, Pandora's
box is open full and all the snakes are out now!!!

On the filters, I have both a 500hz and 250hz in my TenTec. If the
bands are not crowded the SSB filter is fine, if things are more active
I like the 500hz. The 500hz is the filter I used most, it gives
reasonable tuning ability and keeps the QRM at bay. The 250hz is
only used during contest weekends or figthing the pileups on DXpeditions.
The 250hz filter is very sensitive to tuning and is some what on the
ringy-dingy side. Given a choice of one or the other, I would opt
for the 400hz filter.

If I have offened the units GODS, please accept my humble appologies.
I don't known if the darn things are hz or HZ. Things were simplier
when they were cycles.

>Can an apartment complex or homeowners association ban the use of ham
>radio transmitters?

I don't think the FCC has ever preempted TVI ordinances. They did, in PRB-1, preempt city antenna ordinances. The order in PRB-1 is a limited premption--it didn't declare anything unconstitutional, only a court can do that.

I suppose there may be apartment complexes and homeowners associations that have attempted to ban the use of ham transmitters, but I've never heard of any.

Unfortunately, the restrictions are disclosed to you before you sign the lease or sales contract, so any such restrictions are legally binding. Your best bet is to read the lease or contract carefully before signing away your rights.

>
>2. Can homeowners associations ban antennas, or place height restrictions
>on antennas? Can city governments go the same? I assume that height
>restrictions are OK.

Yes, homeowners associations can, and increasingly often do, ban antennas or place height or type restrictions on them. Their authority is a deed covenent that runs with the property and is transferred to the new buyer if you sell the property.

City governments can do the same, however, using PRB-1, these restrictions can be overturned or relaxed. Note that PRB-1 doesn't apply to deed restrictions.

>3. What can hams do to fight against such rules?
>--

In the case of homeowners associations, there are several routes:

1. Apply for an exemption with the architectural committee.

This is difficult because the committee has no incentive to make such an exemption.

2. Secure enough votes amoung the homeowners to remove the restriction.

Even more difficult since it's hard to convince the needed 2/3 or 3/4 of the homeowners that it would be in their best interests to let you put up what is, to them, an ugly eyesore.

I'm hoping for a court ruling that will declare the more restrictive covenents (those that don't allow any antennas at all) an unconstitutional violation of free speech.

From: sehrlich@lynx.northeastern.edu
Message-ID: <memo.494350@lynx.northeastern.edu>
Source record: 7551

I have a question regarding call signs. If some people let their calls lapse after their license has expired, or some other situation occurs where a person's call sign is no longer valid (upgrades w/request for a new call sign?), where do those calls go?
Why does the FCC go "backwards" with calls when someone passes their exam for a higher level? Why not reuse (recycle) calls which were given but no longer in use (valid?)
Also, what happens when all possible calls for all classes are gone? Will we be using new letters? Recycle old calls? Go into longer calls (Novice -> 3 x 4/4 x 3, Technician/General -> 2 x 3/3 x 2), etc.?
And finally, what ever happened to the "other way"? By 'other way', I am referring to the fact that the Technician license is generically known by the 1 x 3 format, Novice by the 2 x 3 format, etc. If the FCC is running out of these, what ever happened to the inverse -> Novice 3 x 2, Technician/General 3 x 1? Do we see many of these formats around? No. (At least I haven't seen the 'inverse' format around too much.

Thanks.

Just wondering.

> >
> > This is just TOO much!
>
> Everyone who needs to call for emergency service has access to
> the E9-1-1 system, EXCEPT HAMS. This looks like a problem to me.

In a panic situation, you somehow forgot to tell the dispatcher your location
and the dispatcher never asked for it. After a few minutes pass, you call
back wondering where the emergency vehicles are. The dispatcher tells you
that they are on location now and are unable to find where any problems are.
You tell them that two vehicles are on fire now, and they tell you there are
no other vehicles on the hill and no smoke to be seen anywhere. Eventually
you figure out they are dispatched to where the phone line is installed, are
the wrong jurisdiction, and the dispatcher is now sending out a response to
the location you indicate. Someone could DIE 1 minute before arriving at
the hospital.

Hams do have access, but it might not be properly identified, and that
might cause problems in some (rare?) cases.

> > Problem: When dialing 9-1-1 from the repeater autopatch, the repeater

>
> Yes it could, unless the ALI was modified (I've seen it done - I
> have worked in a real, live E9-1-1 PSAP myself) and the operators were
> properly trained.

What do you normally get to find out about a call?

What would you think would be best to see in place of (or in addition to)
that information to properly tell you about a ham repeater/autopatch that
has coverage over a wide (possibly multi-jurisdiction) are?

> > The solution is to eliminate the ALI (Automatic Location
> > Identification).
>
> Wrong. The solution is to IMPROVE the ALI.

I think Tad's "solution" was a reasonable TEMPORARY one to deal with the
"mismanagement" that appears to exist in his jurisdiction. There being
no ALI at all at least gets the dispatcher to ask for the needed information
instead of assuming what the computer gives them is correct (read my case
scenario above). Commentary ALI that describes to the dispatcher exactly

what the situation with that phone line is will certainly be better.

> > Now Mr. Stark Raving Ham is PISSED OFF, because....well, no one's

> "flaming" is defined. Care to describe the above comment?

Actually, "flaming" can include direct attacks on ideas as well. When someone is (perceived to be) upset, their statements can also be interpreted as an attack as well.

> > This guy actually sent me mail, saying he USED to think Seattle
> > was an OK place before he read rec.ham-radio and found out what
> > a LOUSY 9-1-1 system it has!
>
> I would like to see a copy of this alleged mail. I sent no such
> message. Show me. Now.

That was one of the errors. I sent that mail to Tad, and he got it confused. But he did catch it shortly thereafter, although I did not get that one before I made another posting dealing with that. Some of my mail was bording on the "flame" side, so that is probably much of the source of confusion. Things are settling down on this issue a little bit, so maybe we will soon come to a convergence of understanding.

> Perhaps another issue has crept in here that obscures the
> original argument. Do you transmit "out-of-band" as a ham or as an
> authorized member of an agency with operating authority on those
> frequencies? (I am assuming that, as you state, the equipment itself
> is legal re certification.)

In my own case, I an trying to examine BOTH possibilities:

1. I could operate AS A HAM, on a public service frequency (violating
97.301), using a non-type-accepted radio (irrelevant AS a ham),
and invoke 97.403 to cover the violation of 97.301 for the type
of emergency intended to be covered by 97.403 (whatever that is).

2. I could operate as a member of the public service agency I volunteer
for, on a public service frequency not normally used by that agency,
communicating with dispatchers that ARE familiar with that agency
(we sometimes borrow a dispatcher for our storm spotting), but using
my modified ham radio equipment that is NOT type-accepted and is NOT
certified. This would be in violation of FCC rules I don't have
copies of right here, but might also be exempted similar to 97.403.

The only case I am concerned with is a REAL EMERGENCY. There appear to be
many hams and non-hams using non-type-accepted nor certified equipment in
routine public service/safety roles. But that is an issue I am not now
addressing, so I please don't get these things confused.

> If you transmit on frequencies allocated to another service as a
> member of that service, then Part 97 does not apply to your
> communications at all. You are then bound by the applicable regs for
> the service you are using and the general regs for all radio users.
> The fact that you also happen to be licensed under Part 97 as an
> individual is immaterial.

Agreed. That DID begin with an "If".

> In my *opinion* this is different from the case of a ham who
> takes his HT, which is only certificated for amateur use, and modifies
> it for out of band coverage for whatever reason. If he can get the
> radio certified/type accepted/whatever by the FCC for the additional
> frequency coverage, the radio itself is legal. Then all he needs is a
> license in the appropriate other radio service OR authorization from a
> licensee to transmit under their license. That takes him completely
> out of Part 97.

That is *IF* the ham is going to use the radio in that service.
This would apply just as well to a NON-ham who has ham equipment.

> Remember that this whole thing got started by somebody who
> stated he was trying to access non-ham repeaters with ham equipment
> and wanted advice on how to attain the odd split. Nothing in the

> the amateur service, he could have simply contacted a service shop or
> the manufacturer for this info. Even if he simply preferred to ask
> fellow hams for advice, mentioning the above might have made life
> easier.

I contacted a service shop just to see, and they had no idea of what I
was talking about. I guess I need to go read all the rules on that.

> The beginning of Part 97 (Basis and Purpose) mentions "self
> policing" as one of the traits of the amateur service. I don't think
> any of us take that to mean playing radio cop with each other. I do
> believe that it obligates us to at least try to keep each other out of
> trouble.

Just picking nits here, if the "ham" was going to be operating ILLEGALLY
in another service, it would NOT fall under Part 97 Basis and Purpose for
self policing. You could just turn him in to the FCC or you could just
forget it. On the other hand you may have done him a favor by telling him
that he might be setting himself up for legal problems.

Or, get one of those mag mount rubber ducks (I had always wondered why in the world anyone would want a mag mount rubber duck, now I know!) :-)

> of "auxiliary" operation, which (I think) must be done on a different
> band from the main transmission. There are restrictions in the rules
> as to who may engage in auxiliary operation.

97.201 covers the rules on Auxiliary operation. In summary:

Frequencies allowed: License classes required:
220.5-225 MHz Technician
420-431 MHz General
433-435 MHz Advanced
438-450 MHz Extra
all higher bands

Automatic control is prohibited unless it is part of a repeater
system that is under automatic control.

The same rule about interference between coordinated and non-coordinated
stations applies as it does for repeaters.

One way transmissions are authorized.

Also from 97.213:

Remote control via radio requires use of an auxiliary station.

But I cannot find any rule that says that the auxiliary station has to be
on a different band (than, I guess, whatever other stations it is connected
to). Usually it is a TECHNICAL need to do this, but if you can overcome
that need (e.g. a set of cavities) you could operate INBAND. But clearly
you cannot be INBAND on 2 meters since you cannot operate the auxiliary
station there at all. But I see no problem with doing it on 220 or 420.

Well, I've been kicked into starting the un-net once again.
My 10m rig is currently on mothballs :-), but thats no reason for
EVERYONE to stop un-netting. So, everyone, lets see some 10m activity
on Saturdays at 1700 UCT through 1900 UCT. Check on or around 28.390MHz
and 28.410 MHz, USB. (USB? LSB? Shucks, I forget! Boy, has it really
been THAT long? Use whatever is standard for that band...)

If 1700 through 1900 is very bad (or if you just prefer a different time),
email me and I'll start a 'real vote' on the issue (whatever "real vote"
means :-).

So, grab your 10m rig and talk to your usenet friends!

I saved this from the net a while ago:

Albert Einstein, when asked to describe radio, replied: "You see, wire
telegraph is a kind of a very, very long cat. You pull his tail in New
York and his head is meowing in Los Angeles. Do you understand this?
And radio operates exactly the same way: you send signals here, they
receive them there. The only difference is that there is no cat."

> phones, or use cellular, should realize that they are "transmitting".

Why? The average layman doesn't know beans about the technology of HOW those things work. The "expectation of privacy" concept of someone whose only knowlege of radio is that it's like TV only without pictures is totally different from a ham's or an engineer's. I once tried explaining to a friend that her baby monitor could be heard as much as 1/4 mile away. She refused to believe me ("because I've got the other half of the pair").

> IMHO if "their" transmissions are in "my" air then they are "mine".

Aside from the question of whether it's "your" air exclusively, there's the question of whether the information content ownership is a separate issue from the possession of the signal by which it is transmitted. So far, the courts have agreed that it is.

I think swls are going to have to get used to the idea that as radio use for such applications increases, the pressure to guarantee privacy is going to increase.

Moreover, there is the fundamental issue: why would any decent person WANT to eavesdrop on the private lives of others?

There will no doubt be a contention that transmitting certain types of radio signals (such as baby monitors and cordless telephones) ENLARGES the personal space. I grant the right to determine if an RF signal entering my space harms me in some way. I doubt that that requires that I inspect the information contents of that RF signal.

> Think about it ... If monitoring cordless phones is illegal, then what

> are censorship, plain and simple.

Strange, but the U.S. is one of the very few places where people feel this way. In most other countries, including very democratic countries, the attitude is that the public only has the right to listen to radio transmissions that are the public's business. Listening to "private" radio transmissions is forbidden. ("That's rude, old boy!")

If you are speaking of 'phone patches, yes, it must originate there. If you
mean can you send a MARSgram, the answer depends on whether the APO/FPO zip is
on the approved list. This is not automatic for all APO/FPO numbers everywhere.
It depends on whether there is a MARS station for that immediate area.

Recreation contacts (other than overseas morale 'phone patches) are never
authorized.

> That is only my opinion, however. I am not a communications
> lawyer or FCC investigator. It might be an interesting question to
> pose to someone who is.

In my case I'm not talking about being in a "routine" situation, such as your firefighter example. I am concerned about the SUDDEN EMERGENCY situation where SECONDS might even determine if someone dies. I'd rather arguing my case in front of an FCC judicial administrator rather than going through a few years of psychological counselling because I let someone die because I looked for a phone instead of using a radio I have.

Secondly, I would NOT pose the question for any sort of "official" answer outside of an actual case because there are too many possibilities. This is ONE of the reasons many laws are intentionally written vague. If you ask an FCC investigator or staff lawyer, they could very well say "no" when, if they were your judge, they would say "not-guilty", just because of the nature of their functional role in the FCC. Do not pose the question to them. If you want a legal analysis of it, your laywer or a communications attorney would be the proper people to see.

Agencies certainly don't want others on their frequency, mostly because there are people who, mostly from lack of training, would interfere with their operation. Unfortunately there are a lot of people out there who would be what these agencies fear, and these people have ham tickets, too.

2156. The return of the callsign project!

Newsgroup: rec.ham-radio
Date: 1990-10-18 23:27:56 UTC
From: rusty@qip.UUCP
Message-ID: <5117@qip.UUCP>
Source record: 7566

Well, I've gone and done it. I ordered the FCC Ham radio master database, to be current as of 10-19-90 (thats Friday, as in the day after I posted this). I hope it will arrive sometime before the end of November.

Those of you who know what this is, the queue will be FIFO, so the first tapes will go out first. As I mentioned, our cost went up a bit, and I may have some trouble with cartridges, but the race is on. (For those of you who don't know wht this is, and would like to know, email and I'll explain.) Notice that the NTIS did us over again, so our cost went up to $25 each. Sorry about that.

Oh, yes - my address changed. It is now either

Rusty Carruth @ P.O. Box 27001, Tempe AZ 85285 (just like my .sig says!)
or
Rusty Carruth @ 245 W. 10th Place #6, Mesa AZ 85201.

The advantage of using the p.o box is its safer. The advantage of using my home address is its a bit faster, but they will probably leave the media outside, so safety will be lower. It is your media, you choose.

Any questions, email or call. (602) 953-4456 daytime, 898-9274 eves (but please, after 6pm and before 9pm MST (NOT Daylight savings time!))

>restriction, and after a "reasonable" time no-one challenges you on
>it, the court MAY hold that they abandoned the contract by failing
>to enforce it.

This is true. I've had my HF6VX up for two years now. Nobody
complained. [BTW, the ground-mounted vertical is probably the most
discreet antenna around - I put mine next to the house, and it
disappeared.]

As a practical matter, the enforcement of CCRs is usually turned over
to a homeowner's association. Unless they have an extremely vigorous
enforcement gestapo, contract abandonment is very likely. The only
other people that could report you to the gestapo (the neighbors)
probably don't even remember all the fine print on the CCR document
and the other flurry of documents they signed when their house closed.

>The problem is that both of these routes are expensive, risky and can
>lead to neighbor problems (which is bad new for everyone). We had
>a ham here in AZ who spent $22,000 fighting deed restrictions that had
>prohibitted him from putting up a dipole, and he lost the case.

The other practical aspect of homeowner's assn enforcement is that
most of them are flat-broke. The legal strategy is to get your lawyer
to file expensive and time-consuming motions until their money runs out.

>I am not a lawyer. These are just my opinions. Your mileage may vary.

I'm not a lawyer, either. These are just some personal observations
from another ham stuck under a CCR.

I wonder now if, because the antenna clause was abandoned on my CCR on
enforcing the HF6VX on the ground, I can now put up a "real" antenna on
top of the roof. (heh, heh, heh.)

>When you finally do get that new D-104 crystal mic

Sorry, Richard, I got the D-104 first, then borrowed an iambic keyer.
I'm not about to throw away perfection. What you say is true, though -
the CW bands are much more orderly. When they aren't orderly, the
100 Hz filter takes care of the riff-raff. Maybe that's it - nobody
behaves rudely because it is so easy to tune them out.

Anyway, nice article. Engage your systems' flame filters, because the
no-coders haven't figured out that CW can be fun/challenging/relaxing -
in short, the reason why you become a ham in the first place.

I've had some luck with a horizontal loop in situations requiring a small antenna. You'd just tape the wire along the top of the walls in your largest room. Connect it to a tuner via cheap twinlead you buy at a hardware store. Don't worry about dimensions, just get as much wire up as you can. Let the tuner worry about SWR.

Apartments are a problem, though, because you're so close to someone else's TV. Even if you don't transmit any harmonics, you'll probably overload the TV's front end. 10 meters is especially bad, because its 2nd is on channel 2, and it's 3rd harmonic is channel 6.

Maybe a lower-power rig would help. G'luk. I think, in the end, you'll have better success with the club station.

Perry/KF0CA

From: brianr@hprnd.HP.COM (Brian Ripley)
Subject: TV twin-lead J-pole Antenna
Organization: HP Roseville Networks Division

The following is a description of a J-Pole antenna made from 300 ohm
TV twin-lead. Quite a few of the hams in the area have successfully
built one or more of these antennas. They have quite a few advantages
which include improved performance for 2-meter HTs, portability, and
last, but never least, they are inexpensive.

```
| | do not short this end.
| |
| |
| |
| |
| |
54" | |
| |
| |
| |
| 1/4" gap
| |
| |
| | 16 3/4"
coax shield ==>* *<== coax center conductor
| |
1 1/4" | |
-*-
solder the twin leads together at bottom
```

1. Start with 54 1/2" of TV twin lead (foam core does not work as well)
2. Strip 1/2" of insulation at bottom and solder wires together.
3. Measure 1 1/4" from soldered wires and strip insulation on both
sides. This is the solder point for a coax feedline.
4. Measure 16 3/4" from bottom and cut out 1/4" notch on one side.
5. Feed with a length of RG58U coax. Tape coax at feedpoint to the
twin lead for strength and weather protection.

I have also attached an aligator clip to the plastic on the top of
the antenna in order to conveniently hang it. I am successfully using
one in my attic to avoid any CCNR problems. I have another that I can
take with me camping, sailing, etc.

This design has appeared on many BBSs and in club newsletters; the
earliest reference that I know of is a Jan. 1984 D.A.R.C. antenna
article by James Burks, KA5QYV.

Enjoy,
N6UBM

From: "Geoffrey_C._Williams.WBST207V"@XEROX.COM
Subject: Re: TV twin-lead J-pole Antenna
Organization: The Internet

I have made and used these 300 twin lead antennas for over ten years.
Another good way to mount them is after assembly, as described by
brianr@ucbvax.Berkeley.EDU (Brian Ripley). slide the whole thing inside a
length of 1/2 inch dia pvc tube put on an end cap, seal up the bottom and
you have a permanent cheap J pole. I have one on my roof thats been there 7
years through almost 8 Rochester NY winters, so do'nt think they are not
rugged.
If you wish to get a real good match another trick is to solder a pin to
the end of the coax center and shield, then probe through the insulation
to find the best match. Having found the best point then you can remove the
insulation and make the final solder joint.

Enjoy - Geoff Williams G4JJO

From: perry@hpfcdc.HP.COM (Perry Scott)
Subject: TV twin-lead J-pole Antenna
Organization: HP Ft. Collins

Some comments on construction:

1. To tune for 146.000, 1/4" was pruned off the J, and 3/4" off the
radiator. The top of the J is 3/4 wavelength, while the stub is
1/4. Prune in a 3:1 ratio.

2. Tuning. The length of the radiators affect resonant frequency,
while the feedpoint position affects feedpoint resistance. To
change resonant frequency, prune. To lower the entire curve, probe.

3. For mechanical strength, I used tie-wrap to (loosely) tie the RG8X
coax to the lower end of the J while probing & pruning. This causes
RF to couple into the shield, so wind the coax into 3 turns at ~1"

o.d. just below the tie-wrap. Wrap with electrical tape.

4. Use the stickpins as described by G4JJ0. I just left them in place after probing and pruning for minimum SWR, and soldered everything together.

5. Cinch up the tie-wrap as tight as you can, then wrap the lower end of the J in electrical tape to keep water out. You may also want to wrap the other exposed areas with tape if the J is going outside.

6. For portable operation, I cut a small hole at the top for hanging. A bit of monofilament allows the antenna to be hung almost anywhere.

Enjoy,
Perry Scott/KF0CA

However, you _assume_ the requestor of the mod info is _not_ authorized
to do what he was asking to do. He might be, he might not be. To say he
_is_ doing something he shouldn't be is making assumptions based on facts
not in evidence (sorry, too much Perry Mason).

> In my *opinion* this is different from the case of a ham who

> radio certified/type accepted/whatever by the FCC for the additional
> frequency coverage, the radio itself is legal.

The radio itself is legal whether or not it is certified/type accepted
for out-of-band. He couldn't sell it, but there is NO CRIME in posessing
a radio with oob capability. Like mine, which covers all but is certified
for one specific freq, is legal even when the tuning dial read 5686. Note
I said posessing, not using.

> Then all he needs is a
> license in the appropriate other radio service OR authorization from a
> licensee to transmit under their license. That takes him completely
> out of Part 97.

If he ain't under Part 97, why all the quotes from it? In fact, no oob
operation is covered by 97. Part 97 says what freqs you MAY use, not what
you are prohibited from using. Anything oob is covered by other regs.

> Remember that this whole thing got started by somebody who
> stated he was trying to access non-ham repeaters with ham equipment

> the manufacturer for this info.
^^^^^^^^^^^^
I took that route, mainly because an entrepreneur who does the mod I
needed wanted $50 to do it. Kenwood, in their infinite wisdom, decided to

keep it a deep dark secret. I had to fax them my licensing info TWICE and make several calls over a 5 week period to pry the mod info from their fingers. They couldn't just tell me "chop R34" (not the right number, don't chop it in your radio and expect it to work anymore). If I had had access to rec.ham-radio, I would have asked here. If I had gotten the response that the other fellow got, I would have walked away from this group.

>Even if he simply preferred to ask
> fellow hams for advice, mentioning the above might have made life
> easier.

For whom? He asked a simple question, expecting a simple reply.
Instead he got told "I don't think you should do what you want. I don't know what you want to do for sure, but it surely must be illegal."

> The beginning of Part 97 (Basis and Purpose) mentions "self
> policing" as one of the traits of the amateur service. I don't think
> any of us take that to mean playing radio cop with each other. I do
> believe that it obligates us to at least try to keep each other out of
> trouble.

Unfortunatley, we have already decided that what he wants is not covered by Part 97, so self-policing doesn't apply. This country was started by people fleeing from situations where their neighbors were just trying to keep them out of trouble. "You're worshipping the wrong God, you gotta worship mine or you are in DEEP trouble." In other words, individual responsibility still exists. I can't blame Yaesu for making oob operation so simple when the Feds knock on my door. If my neighbor wants to leave $20 bills on the sidewalk, I can say "are you sure you wanna do that", but not "I prohibit you from doing that, so I won't even tell you where the sidewalk is." If he wants to drive 80 MPH in a school zone, I can't stop him.

This is my signature. It doesn't contain my name at all!

randall@informix.com (Randall Rhea) suggests:

>>Fewer families are able to buy a house now than at any time since the
>>Great Depression. This forces most of us to live in an apartment, or at
>>best a condo. Putting up a good antenna for HF is almost impossible in
>>these environments. Even if you can put up an antenna, TVI (and especially
>>VCR-I) is so severe that it's sometimes pointless, unless you want a lynch
>>mob after you.

>>What does this mean? Base station hamming is on the wane. You will notice a
>>large number of mobile HF stations, especially on 10 meters, and I think the
>>trend will continue. CW is not a medium that is suited to mobile operation.

Well, I've seen some weird anti-CW reasoning on this net, but this is a new one on me! I've worked quite a few /M stations on CW, including someone running 50 watts driving to work in Tokyo (egads). I also remember a long CW chat with K5NA who was driving to Florida and was glad to have someone to keep him awake for a while during the drive.

But allow me to come to the opposite conclusion. If you think you are going to cause RFI then you certainly ought to go on CW! It's not quite like using AM, which is decipherable, but even SSB RFI will lead the neighbors to suspect a human at work (or at least a ham), while all those "pops" could be anything. When I was in Israel last year I saw some ham antennas that shared a rooftop with TV antennas (and many of the 4X population watch TV from JY as well as 4X, so this isn't strong-signal stuff), and when I asked some of the hams how they avoid interference they said that (a) they tend to operate late at night, and (b) they use CW a lot.

You want another reason to use CW? If you are interested in working DX (or is that a dirty word around here too?) you have to be very masochistic to do it entirely on SSB. Tonight was a good example - in a short time tuning around the HF bands, I found 3 DX stations that I was interested in working. One of them was in Mongolia, JT1BR on 15m CW, I called him once and worked him. The next was Sri Lanka, 4S7CF on 20m CW, I called him once and worked him (OK, there were others calling both of these guys, maybe 3 or 4 people that I could hear). The third was Narau, C21DX on 10m SSB. The guy was swamped with callers, he had to go by call areas to reduce the crowd. He asked for people from the 3rd call area, many 3s called but lots of 6s, 2s... Some just called and called and called, even while the guy was talking. Others got on frequency and told them to shut up, people called each other names, other people told them to shut up, meanwhile the C2 was working someone but I couldn't hear most of his transmissions. I made a few calls when the guy was listening but even if he'd come back to me I wouldn't have known

because of the lids still calling him. Maybe C2 is rarer than JT and/or 4S, but I remember working C21XX on CW when I was the only person calling him, and the latest "most wanted" list I saw had Mongolia among the top hundred countries wanted, but neither of the others.

This is not atypical. There are large phone pile-ups for pretty common DX (there were many more people calling a Uruguay station on phone than there were calling the Sri Lankan and Mongolian on CW combined. There are some fine phone operators but there are many many LID operators on phone who spoil the fun for me a large fraction of the time.

And yes, I know that not everyone likes working DX, but if you do then it is silly to do it on phone all the time unless you like beating yourself over the head for relaxation. I'm getting pretty tired of all the bleating about CW on this net, and the put-downs that result when anyone makes a reasoned argument for using it. I don't feel any need to apologize for liking it, any more than I do for preferring Bach and the harpsichord to rock music. In fact, I don't know why I'm even mentioning the advantages, the more people who find out about them the more crowded the CW sub-bands will get and the more the lids will cruise by to spoil things for us.

I feel much better now.

I've been getting more and more interested in the whole amateur radio thang, but I'm not sure how to proceed. I picked up a copy of CQ (?) and it was, despite all my engineering intuition, utter gibberish :-)

Are there books on the subject that are widely available?

I looked in the phone book, but was unable to find an a listing for any clubs. Is the usual procedure to latch onto a mentor for a while? Anyone in the Portsmouth NH area feeling the need to teach? :-)

I think that I'll be mainly interested in the computational aspect (i.e. packet BBS, getting weather satellite data, that sort of thing) but then I've never tried it so I'm open to trying anything.

It was only a matter of time... once I saw the pictures of the equipment with lotsa dials and das blinkenlights, I was hooked on the idea! :-)

>restrictions.

As both a ham and a city councilman, the above is not quite as
simple as that. Antenna restrictions can be instituted by a
city/municipality for valid and defendable reasons. An outright
ban on ham antennas would likely be viewed as arbitrary and capricious
by the courts, BUT a restriction can be justified on the basis of
safety and zoning. For example: It doesn't take much effort for
a city to defend a height restriction that incorporates verbage
to the affect "No antenna shall be installed that if it fell
from its base would extend beyond the property line of the owner."
Clearly, if I then happen to live on a lot that is 100' by 100',
the maximum antenna height I could install would be 50' if I
installed it in the exact center of my property. The closer I
wanted to locate my antenna to any one property line, the lower the
allowable height.

Now you may not agree with this, but a similar "law" is in place in a
local municipality (not mine) and will probably not be challenged,
and if it is, the challenge will not (IMHO) be won by the ham.

Short of banning ANY type of general coverage receiver, I can't
see what outcome any pressure would have on the radio listener,
be that an swl or simply someone that has a radio. At this point,
there must be millions of very broad coverage receivers in the
hands of the public (Both regular types and scanners). Are we
to expect confiscation? Legislation limiting future receivers/scanners
manufactured from being able to receive certain frequency ranges
(that's done now with the cellular on scanners, but it's a
simple task to modify most of those scanners after ownereship.)?

At some point, if there is a call to restrict receiveing of a
multitude of frequency ranges and specific frequencies, it becomes
(IMHO) almost impossible to design a cheap scanner/receiver.
Note also, the use of the radio spectrum is not static. What
you find in a particular frequency range today may not be the same
10 years from now.

So what's it all mean? Again, IMHO, I really doubt that much
will happen in the area of prohibiting general coverage
receivers or significantly limiting multiple ranges of
frequency coverage. Having said that, it does remain incumbent on
all of us, hams AND swlers to remain vigilant and sound the
alarm immediately at even the first sign of any such global
restrictions in equipment design being instituted.

>
> How do you educate them - gently?

You don't. They don't want to hear it. They believe what they want
and ignore the rest. I have a brother, well educated, an Engineering
degree, not naive about radio. He has one of those stick it in your
ear and walk around cordless phones. He is also convinced that it
doesn't radiate beyond the confines of his house. He knows what radio
is, but is convinced that the phone was manufactured to protect his
privacy cause the owners manual says so. But then, maybe he is naive.
The point is, even though I can pick up cordless phones from as far
away as 15-20 miles on my 6 meter rig, you still can't convince the average
consumer of that fact.
I have given up trying. But I don't and won't have a cordless phone in
my house.

You might consider donating them to one of the following museums:

Museum of Communications (Dallas, TX) [might be deductable]

Southwestern Bell Museum (Dallas, TX) [just try and deduct it!!]

While both of these have a lineup of 14/15/19/26 machines, I'm sure they need parts, cuz their machines _work_. I think SWB might have a museum in Houston, too.

>Moreover, there is the fundamental issue: why would any decent person WANT to
>eavesdrop on the private lives of others?

This is an excellent example of how asking the question will influence the response. The fundamental issue is NOT whether decent people want to snoop on others. Rather, its a division in philosophy between freedom and privacy. On the one hand, people are generally ignorant about the technology they use. As I recall, many congressmen were stunned to find out that anybody with a Radio Shack scanner could listen in on the cellular conversations. That realization (plus a little high power bribing -- no *campaign contributions* -- from the cellular industry) led to the ECPA. On the other hand, this country has (at least historically) prided itself on its emphasis on individual freedom. Virtually unenforcable laws like the ECPA are an attempt to restrict one's freedom, something that most Americans still value pretty highly. I like to pick up a copy of Orwell's _1984_ and reread it every few years. Partly to enjoy it, but partly to remind me to keep my guard up against our benvolent government (grin). Freedom is hard to win and easy to lose; one minor loss leads to another, which leads to another, and so on.

I was listening to HF last night and as I scanned through the 6mHz area the radio stopped on what sounded like packet transmissions. I hooked up my handy-dandy PK-88 and set it for 300 baud and lo and behold packet headers started showing up. The only problem is I don't recognize the calls that I am seeing. I suspect they are MARS transmissions but I'm not sure. Here is an extract:

>a court can do that.

Errr..ahhh....yeah they did. Please refer to this month's QST(I think
in the "Happenings" section) for an illustration. An Arizona Appeals
court has upheld a lower court ruling that threw out a nuisance suit
against an amateur for causing TVI. The court held that TVI issues
were exclusively the jurisidiction of the FCC and action by the FCC
was the exclusively remedy to such problems. This has been the
position of the FCC for quite awhile(and this isn't the first such
suit.)

>I suppose there may be apartment complexes and homeowners associations that
>have attempted to ban the use of ham transmitters, but I've never heard
>of any.

Oh there are lots of these....they usually don't go after the transmitter,
it's nominally that unsightly antenna they try to get after...

> some stuff deleted...
>Yes, homeowners associations can, and increasingly often do, ban antennas
>or place height or type restrictions on them. Their authority is a deed
>covenent that runs with the property and is transferred to the new buyer
>if you sell the property.
>
>City governments can do the same, however, using PRB-1, these restrictions
>can be overturned or relaxed. Note that PRB-1 doesn't apply to deed
>restrictions.

All true....note further that PRB-1 isn't going to be sufficient to
completely rid you of antenna restrictions....they just have to be
"reasonable," i.e. they have to allow you to communicate. Several
cities have enacted restrictions at say 55' or 65' that hams in the
community have helped craft. These are usually reached as a compromise
solution.

>Anyone know the effect wire insulation has on the length of a resonant
>dipole? I've always used the formula 468/freq to calculate the length
>of bare-wire dipoles. What does the numerator change to if the wire
>is insulated?

In practice, the insulation has very little effect - including it in your calculations wouldn't make enough difference to worry about, as you're still going to have to cut long and trim to resonance. Surrounding structures and height-above-ground affect the final resonant length so much more than wire diameter or insulation that dipoles are always going to be a "cut-and-try" proposition.

Remember, the 468/f formula is a *approximation*; you shouldn't expect it to give you an antenna that is exactly at the right length for your installation. For example, at 7.2 MHz, the formula gives an antenna length of 65 feet. That's almost exactly 95% of half the free-space wavelength, so it's a pretty good "first cut" - but I'd still measure off more like 70 feet of wire (to allow plenty of extra for tying to the insulators, etc.) and then start cutting and watching the meter.

One trick I used for a dipole was back in my Novice days when my parents house was on a lot with two phone poles spaced about 70' apart. (Y'see, the previous owner was a ham who worked for the phone company.) Anyway, I built the dipole and laid it out on the ground, then hauled it up to the tops of the poles via pulleys I'd mounted up there. To trim the antenna (and later, to do any maintenance on the cable, etc.) all I had to do was untie the ropes at the bottom of the poles and lower the whole thing back to the ground.

2186. USA Call Sign Allocation

Newsgroup: rec.ham-radio
Date: 1990-10-19 17:24:29 UTC
From: gay@venice.SEDD.TRW.COM
Message-ID: <879@venice.SEDD.TRW.COM>
Source record: 7496

Here is the latest call sign allocation scheme from the 1989 FCC rule book:

```
Group A (Extra) Group B (Advanced) Group C (Gen/Tech) Group D (Novice)
--------------- ------------------ ------------------ ----------------
K#$$ * KA1$$ K#$$$ * KA#$$$-KZ#$$$
N#$$ * KB#$$-KS#$$ N#$$$ WA#$$$-WZ#$$$
W#$$ * NA#$$-NZ#$$ W#$$$ *
AA#$-AK#$ WA#$$-WZ#$$
KA#$-KZ#$
NA#$-NZ#$
WA#$-WZ#$
AA#$$-AK#$$ * = Call signs using these prefixes not currently issued.
```

Group A notes: The following prefixes will not be assigned to stations in the contiguous 48 states: AH KH NH WH NL AL KL WL KP NP WP AP. Pacific-area stations will be assigned AH#$ KH#$ WH#$, then Group B. Alaska-area stations will get WL7$ KL7$ NL7$ then Group B. Atlantic-area stations will be assigned KP#$ NP#$ WP#$, then Group B.

Group B notes: KA prefixes will be assigend only to persons living in the 1st call district. Other KAs are assigned to US personnel living in Japan. The following prefixes will not be assigned to stations in the contiguous 48 states: KH KL KP NH NP WH WL WP. Pacific-area stations will be assigned calls in the format, AH#$$, Alaska-area stations, AL7$$, and Atlantic-area stations, KP#$$. Once Group B calls are used up, Group C calls will be issued.

Group C notes: Pacific area stations will be assigned KH#$$ NH#$$ WH#$$ in that order, Alaska-area stations KL7$$ NL7$$ WL7$$; Atlantic-area stations NP#$$ WP#$$. After these are depleted, Group D will be used.

Group D notes: The following call sign formats will not be assigend to stations in the contiguous 48 states: KH#$$$ KL#$$$ KP#$$$ WC#$$$ WH#$$$ WK#$$$ WL#$$$ WM#$$$ WP#$$$ WR#$$$ WT#$$$. Pacific-area stations will be assigned KH#$$$ WH#$$$; Alaska-area stations will be assigend KL7$$$ WL7$$$; Atlantic-area stations KP#$$$ WP#$$$.

2187. HW-100 fileter ters

Newsgroup: rec.ham-radio
Date: 1990-10-19 17:24:39 UTC
From: jhk@SATURN.ACC.COM
Message-ID: <9010191724.AA03727@saturn.acc.com>
Source record: 7497

Hi Wally;

I'd suggest using the 400 hertz fileter ter. I had a n HW-100 from 1969
through 1983 and had updated it with all of the mods of the HW-101,
which came out later (I worked for Heath for a while, so it made it
easy!). The 400 hertz filter gave a really "peaked" response and
also rang a bit as any filter this narrow normally does.
Unfortunately, the original design of the 100/101 set up the rat dio
to transmit 1000 Hertz away from the receive freu quency, so the peak
on the 400 hertz filet ter was set up at an audio tone of 1000 hertz.
I changed mine to a more m pleasant 700 hertz by chag nging (I think)
the CW BFO crystal up or down 300 hertz.

By the way, the 101 had a switch to go from the ssb to cw filet ter
that was an add-on to the 100. It fit in back of either the RF
or AF gain know b , and was a mechanix cal lash up to throw two cheapie
slide switches to select the appropriate filter.. You might want
to see if you could borrow a 101 manual, get the parts numbers,
and call he Heath for parts department to see if they still have it in
stock (the parts for it, that is; I don't think it was an assembly).
I'd also check for availability of the 400 hz filter, which is f
available is probably cheaper than the Fox-Tango. Also, there is
not any reason that would prohibit you from mounting two small
relays (SPDT) in the vicinity of the filters underneath the chassis,
and putting a SPST toggle w switch to activate them on thr e front
panel. I do not suggest using one DPDT th relay, because you really
want to isolate the input and output of the file ter by 60 db or
better for best performance. The impedance here is 2000 ohms, so
keep the leads short. Otherwise, at 3395 khz, the wiring is not
all that critical.

Good luck on your project.

John, WB4LNM

|> Other than that, if I had to choose between 400 and 250, I would take 400
|> for ease of tuning, especially since you don't have the ssb width filter
|> to fall back on.

Yes, tuning is one consideration. I just got a used TS-440S that has Fox-Tango filters in it (the guy who owned it wanted REALLY good filters). Fox-Tango filters have much higher Q and steeper skirts than the standard Kenwood filters, and this guy wanted the steepest skirts he could get. He got 'em. He also got filters so good that they're subject to ringing if the incoming signal's too wide. Therefore, you really want a wider filter. At 250 Hz a clean CW signal will just about fill the passband, and it might sound awfully peculiar.

Of course, if it DOES work right, and if you can tune the radio with the filter switched off, you may have better copy from the 250Hz filter.

I'd say your best bet is to try to get some time on a radio that's got such a filter, and see what it sounds like. Those narrow filters sound awful damn strange, but if you can get past that you may actually find that you like it.

Text edited.....

In Denver, the old individual radio systems of each agency are being
replaced with a new, shared, trunking system...

All the police, fire, parks, trash, water, etc., will be using one
40 channel system...with computer controlled dynamic channel allocation.
This means it will be very difficult to follow a thread of a conversation
as the conversation will keep jumping to a new channel every time one
party unkeys and the other keys up. Part of the justification is to make
it real hard for our crack dealers to monitor the police with the $89.00
scanners. There is also the option on the trunking system for various
types of encoding or scrambling.

As mentioned above, the city is providing units to the major TV and radio
stations...as well as the vultures (tow trucks). There have been a couple
of instances where a TV helicopter has really helped nab some criminal or
helped find someone lost...so they have justified their need to the city
administration.

2195. Re: Kenwood TR2600 Frequency limit modification.

Newsgroup: rec.ham-radio
Date: 1990-10-19 20:09:27 UTC
From: svec@motcid.UUCP
Message-ID: <4867@feldspar2.UUCP>
Source record: 7505

I once heard someone claiming on the air that he modified his TR2600A
to receive the 162.55 weather band. He also alleged (never saw it confirmed)
that he hacked the Digital Coded Squelch modem (which he and I have
never used yet for true DCS) to detect the single warning tone
sent out by the weather service and to keep the radio quiet (as
DCS does) until it hears the weather alert tone on 162.4, .475 or .55
In any case, I tried for months to pry it out of him how he did it all,
sent him enlarged-xerox schematics with return address/postage
envelopes etc. etc. but he never came through. I personally never
saw it in operation but a friend of mine did.
I too would be interested in at least opening it up to 162.55 receive.
One thing I did do in frustration one night was to go into the
diode matrix of 3 or 4 diodes that I know affect ranges of TX/RX
and tried every permutation of them connected or disconnected
(8 or 16 of them) resetting the microprocessor
every time in between to see what it would do to the radio. I got
such results as: Turned it into a European version (TX/RX 144-146)
Made it TX/RX 140-160, made it stock-american (RX 140-160, TX 144-148)
and several combinations caused other unusual limitations, generally
a subset of TX/RX but always between 140-159.995 (where I said 160
I really mean 159.995).
If anyone else figures out how to extend this radio's RECEIVE to 163,
I certainly would like to know (and the net I am sure would like to know
so they can discuss the illegality of opening the transmit to 163 so one
can do their own illegal weather forcasts on 162.55 (just kidding)).

2196. ??What happened to NASA Sat data??

Newsgroup: rec.ham-radio
Date: 1990-10-19 20:19:44 UTC
From: wejones@CRDEC7.APGEA.ARMY.MIL
Message-ID: <9010191619.aa22380@crdec7.apgea.army.mil>
Source record: 7506

It has been quite a while since I have seen the NASA style
satellite orbital elements posted. Are they no longer available?
Is there an FTP site where this data is available? A logical
source would be the ames.nasa.gov site which supplies near daily
updates on other launch information, but it doesn't appear there.
You would think that as important public image seems to be to NASA
that they would provide such information as a public service to
those who enjoy tracking the birds.

Also, does anyone know of an up to date source of the frequencies
used by the various satellites? I have a book with an extensive list,
but most of the birds listed are no longer active.

>the maximum antenna height I could install would be 50' if I
>installed it in the exact center of my property. The closer I
>wanted to locate my antenna to any one property line, the lower the
>allowable height.

The allowable height in the above example would probably be more like
30 feet because you have to add the half-diagonal dimension of the beam
to the tower height to obtain the worst-case reach (if the beam and tower
fall flat).

>Now you may not agree with this, but a similar "law" is in place in a
>local municipality (not mine) and will probably not be challenged,
>and if it is, the challenge will not (IMHO) be won by the ham.

It is unfortunate that regulations like this must exist -- There are no
"absolute" guarantees of safety in life. If extended, this would make it
difficult to build fences -- by definition their height would be limited
to zero when placed directly on the property line. I'd bet that a ham
with enough money could beat that regulation.

The regulations regarding tower height limits would be much easier to
defend in court if they were reasonable -- eg the owner of the tower high

enough to present a danger to his neighbors property should have the design engineered and carry insurance in case of incident.

>--Phil Howard, KA9WGN--

I use coax on X-band a lot. It is that really small "hardline", with
SMA connectors. There are a couple of sizes of the semi-rigid stuff; I
don't have the RG numbers, because I've gotten all of mine at swaps.

>
Ugh! What a choice! I think you're going to want to go for the "rig something up" option. I have a choice of 2400Hz, 500Hz, and 250Hz. The "no filter" option is, as I'm sure you're aware, good for absolutely nothing. If I had to live with only one of 500Hz or 250Hz, I'd probably take the 500Hz. With a bandwidth that wide, you can tune and find the guy. It's OK up until you get into contests or a pileup, and then it gets pretty rugged trying to pick out the one signal you're listening to out of the thousands that creep through that 500Hz hole. With 250Hz you cut the window down significantly, but I've found it extremely difficult to tune with my 250Hz filter on. I will take a guess that your 400Hz choice will be the one you want. HOWEVER, this all depends on how wide the filter skirts are. For a while, I operated my rig (an Icom 761) with a 250Hz filter in the second IF only. That was tunable, since the skirts of the filter were not exceptionally steep. But when I added a first IF filter, the skirts became much sharper and it became a lot harder to tune. Even tuning very slowly, I go right over weak stations and never even hear them. Go into your nearest dealer and play with an Icom 781 (which has the 250 Hz filters built in, rather than as an option like the lower-priced stuff). That will give you a feel for tuning with steep 250Hz filter skirts.

SpaceNews
=========

MONDAY OCTOBER 22, 1990

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States.
It is published every week and is made available for unlimited distribution.

* ULYSSES NEWS *
================
Flight controllers began turning on Ulysses's nine science instruments on
Friday. All onboard systems are operating normally. The second of two
Trajectory Maneuvers is scheduled for 02-Nov-90, and will make final
adjustments in the spacecraft's flight path on its way to Jupiter encounter
in February 1992. Ulysses was deployed by recent U.S. Space Shuttle mission
STS-41 on a five-year mission to study the Sun's poles and interstellar
space beyond the poles as well as study the planet Jupiter.

* PIONEER 11 NEWS *
===================
A spacecraft emergency exists on Pioneer 11. Downlink signals from Pioneer
11 have become variable in strength. The problem could be caused by a problem
in a driver amplifier in the satellite's transmitter. Downlink received by
the 70 meter antenna in Australia is in low noise configuration, and the
receivers are locking up for 3 to 4 second intervals. On Tuesday, commands
were sent to the spacecraft using 70 meter antennas in Spain and Goldstone
along with 400 kw transmitters. Receiver lock with the 70 meter antenna
in Spain remained intermittent and no telemetry was received.

* GALILEO NEWS *
================
Galileo's 1200 bps high rate engineering telemetry data was successfully
received and processed last week using both 70 meter antennas in Goldstone
and Australia. Spacecraft performance continues to be excellent.

* HUBBLE NEWS *
===============
The Hubble Space Telescope will be used to study a very large storm which
has suddenly developed in Saturn's atmosphere. The Washington Times
reported that an oval-shaped white spot, one and one-half times as wide as
```

the Earth, has formed in Saturn's cloud belt. Reta Beebe at New Mexico State University reported that two smaller white spots have developed along with the huge oval spot and that the three spots together cover nearly one third of Saturn's surface.

> ...fire departments and ambulance crews deal with emergencies all the
> time... Does that mean they can routinely use ham frequencies...

Of course not. They have frequencies allocated for the purpose. The two situations -- EMT on ham freqs, ham on emergency freqs -- are not symmetrical.

Now if an EMT needed to use a ham freq for some reason while dealing with a "routine emergency", I'd be all for it. The emergency might be routine (for the EMT), but his/her use of ham freqs would not be -- and it would be justified in a bona fide emergency.

> not as biased as you would like to believe.

You can interview someone who is the statistical mean of a group to see what makes up the group. You can interview someone who really knows the issues involved and has prepared the case.

CBS (apparently) chose to use ONE method for ONE side, and another method for the other side. To have been fair to the good ol' scanner buddy, they should have interviewed the average NON-scanner for the opposing side.

Or, instead of interviewing the good ol' scanner buddy for the scanner side of the issue, they could have interviewed someone who knows the issues from the scanner perspective, someone such as Bob Parnass.

The interview definitely was unfair because they expected the AVERAGE person of one side to argue effectively against an educated person of the other side who likely has already researched along the lines of his personal agenda.

Sorry, Jim, you make a poor defense of CBS by claiming that the chosen scanner listener is average.

> sociologist's views.

The right to expect privacy has not changed. Too many people are coming to accept the intrusions of government into their lives, as people have in other countries for centuries. The right of privacy, as are many other rights in the U.S., is fading. That risks a re-revolution to reinstitute what we got in 1776 and lost since.

> Finally, the anthropological concepts regarding territoriality come into play

That is certainly a case of one group against another, and a democratic process alone will usually end up favoring the majority. That does not mean it is right, it only means it happens.

The only way for democracy to work is for those who are participants to be fully and accurately informed. The CBS interview served to DISinform the public, which EXPECTS to see an informed representative of an issue argue the merits of such an issue.

It asserts the authority of the federal government. It serves as a
guideline for the courts and a basis for federal courts to take jurisdiction.

> I suppose there may be apartment complexes and homeowners associations that
> have attempted to ban the use of ham transmitters, but I've never heard
> of any.

Winfield Village Cooperative, Savoy IL. The defendant was an unemployed
Hispanic and there are some suspected overtones of racial discrimination
in the issue. Even after the two original complainants moved out, and
the coop board's contracted investigator found nothing wrong with the
ham station, they pursued it anyway. The case is turning around because
of turnovers in the board. They argued that the basis was a clause
against "causing a nuisance".

> Unfortunately, the restrictions are disclosed to you before you sign the

> allowable height.

Basing a restriction on safety and zoning is just what the city should
be there for. But safety also follows TECHNICAL matters as well.
For instance a properly designed and installed tower, kept in good
condition, will NOT fall flat over. The height limit on a tower that
can be shown to be in good condition by a competent engineer could be
SAFELY placed MUCH higher than its distance from the property line.

I personally would call a rule that places a limit of height equal to
the distance to the nearest property line to be "arbitrary and capricious"
unless it designates this limitation only for towers not found to be in
good engineering condition. If a certified civil engineer signed off on
the tower as not able to fall more than (say for instance) 1/2 its height
from its base, then your could have that tower up to 100' without danger
of it falling on the neighbor's property (from center).

I believe it would be reasonable, and quite likely a good idea, to require
the towers to be certified by a competent engineer to be within reasonable
safety margins (e.g. to not fall upon the property of another). Also, there
are other safety concerns that need to be addressed as well. There need to
be ways to prevent children from climbing the tower or from getting close
to its base. Guy wires at ground level need to have an appropriate safety
mechanism (clearly flagged or inaccessible). Towers high enough to pose
a falling ice danger also need an appropriate protection from people getting
hit by falling ice. Fencing an area around the base of the tower can be a
good way to prevent the climbing and icing problems. All these things
should be inspected as part of the finalizing of the permit to keep the
tower. There also needs to be some regularity of the inspection to maintain
the degree of safety. The ham who wants the tower up should be expected to
pay all reasonable costs of keeping the tower in safe condition and showing
to the authorities that it is safe.

> Now you may not agree with this, but a similar "law" is in place in a
> local municipality (not mine) and will probably not be challenged,
> and if it is, the challenge will not (IMHO) be won by the ham.

How REASONABLE is that law? Does it have any "arbitraries" in it?

Keep your personal space out of my personal space.

An enlargement of the person space would require first establishing the
concept that actual security of the radio transmission really exists.
It would be an invasion of my PHYSICAL personal space for you to determine
if I actually am listening in (and ONLY doing that). Such security does
not exist for signals transmitted in conventional emission modes and not
encrypted. Maybe we need more DES baby monitors.

> No, only the information.

Suppose you toss a sealed envelope into my front yard, which contains
pictures of you and your SO making love. Is that an enlargement of YOUR
personal space? Am *I* violating YOUR space by making an EFFORT (opening
the envelope) to get the information.

I contend that tossing the sealed envelope which has information in it is
no different that tossing out electromagnetic waves that have information
in them. If you toss them MY way, I am CAPABLE of opening either, and you
have effectively given up your right to privacy.

You COULD have setup a wire-based baby monitor. In fact the intercom
system in the house I grew up in had a way for the master unit to listen
in on anything going on near the slave unit. You don't NEED to transmit
over the radio but you simply CHOOSE to.

Also, it is nearly impossible to be able to detect the signal without also
detecting the information. Of course that is decreasing with technology.

Strange, but the U.S. is one of the very few places where people felt this way enough to revolt against an authoritarian regime and establish the greatest democracy the world has ever seen.

Strange, but the U.S. is one of the very few places where we have a diverse set of constitutional freedoms based on the concept that the government has no more authority over people than the people themselves do.

Strange, but the U.S. is one of the very few places were have a reasonable expectation of privacy of the things we do in our own personal space.

> and the dispatcher never asked for it. After a few minutes

Dispatcher's fault, but that's no consolation.

> Hams do have access, but it might not be properly identified, and that
> might cause problems in some (rare?) cases.

Well, that's really the center of the problem. The proper
identification of the caller's location is the heart of ALI. That is
why I mentioned access to E[nhanced]9-1-1.

> What do you normally get to find out about a call?

On "normal" landline calls, the small LED display gives an
immediate readout of the originating number. The number information
is also sent to the telco's billing computer for matching with the
address info. The response from the telco computer is sent back to
the PSAP and displayed on a CRT. This information can be imported to
the CAD event mask by keyboard command.
That is how the system works in Rochester, NY. Your mileage may
vary.

> What would you think would be best to see in place of (or in
> addition to) that information to properly tell you about a ham
> repeater/autopatch that
> has coverage over a wide (possibly multi-jurisdiction) are?

That information in itself _should_ be sufficient. But it needs
to be coupled with proper orientation of the complaint takers and
reiterated during ongoing staff training. In my experience, ham calls
via what is locally called the "Fuzz-Buzz" are relatively uncommon.
Operators tend to forget procedures that are rarely used, so they need
to be reminded.

> I think Tad's "solution" was a reasonable TEMPORARY one to deal with the
> "mismanagement" that appears to exist in his jurisdiction.

I concede that. Hey, Tad! I've been thinking about your
situation. Did you say you were in Seattle, WA? Last I heard, the
director for Seattle's center was Alan Komenski (formerly Director of

the Monroe County OEC here in Rochester, NY). He is also known as
AC2K and I would think he would be more responsive. Has your repeater
group talked directly to him?

> > I would like to see a copy of this alleged mail. I sent no such

You could at least confuse the FCC enough that they would give
up on any prosecution. ;-)

> The only case I am concerned with is a REAL EMERGENCY. There appear to be

OK. They do seem to be separate issues. Separating the
possibilities this way seems to reveal more basic agreement on what we
are saying here.

> That is *IF* the ham is going to use the radio in that service.
> This would apply just as well to a NON-ham who has ham equipment.

Also agreed.

> Just picking nits here, if the "ham" was going to be operating ILLEGALLY

I guess it would depend on FCC's interpretation of which exact
regulations they wished to enforce in a particular case. If the
person doing the transmitting were a licensed ham, I suspect they
would be likely to invoke Part 97 along with any other charges. In
fact, the FCC rules allow them to take action against ANY licenses in
ANY service held by someone found guilty of an infraction.
I would prefer to keep a fellow ham from losing his license no
matter what set of FCC rules would be used to take it away. My intent
was undoubtedly obscured by the overzealous way in which I presented
the warning.

This must be what confused my memory. One of the local 2 meter
repeaters has a control link in the 70 cm band because it can't
legally be done on 2 meters. I must have mentally added that
restriction to all the other bands.

I recognize the scenario that you are using, but my comment
still stands. It _might_ be better NOT to cite the fact that you are
a ham or any Part 97 provisions in a case like that. Again, this is
only an opinion.

> Secondly, I would NOT pose the question for any sort of
> "official" answer

Don't worry. I haven't done anything so foolish. ;-)

Let's not nitpick. You know and I know that the issue is USING
the radio to TRANSMIT out of band. That is a reasonable presumption
of the intent of a transmit mod.

> I said posessing, not using.

Then you and I are not quite arguing the same point.

> fact, no oob
> operation is covered by 97. Part 97 says what freqs you MAY use, not what
> you are prohibited from using. Anything oob is covered by other regs.

Hams have been fined by FCC for transmitting out of band under
the relevant portions of Part 97 covering allowable frequencies. If
you are a licensed ham and transmit outside of your allocated bands,
you are in violation of the sections of Part 97 specifying your band
limits. You may also be found to be in violation of other Parts.

> > Remember that this whole thing got started by somebody who
> > stated he was trying to access non-ham repeaters with ham equipment
> > and wanted advice on how to attain the odd split. Nothing in the
>
> Instead he got told "I don't think you should do what you want. I don't
> know what you want to do for sure, but it surely must be illegal."

Please, please, please read the second line of the above quote
again, or better yet the original message if you still have it. The
individual in question specifically stated that he was attempting to
use a transceiver manufactured for amateur use on non-ham repeaters.
That is illegal on its face, unless he is authorized to use those
non-ham frequencies by licensure or permission of a licensee in
another service AND the radio will be certified as meeting technical
standards for that service.

> Unfortunatley, we have already decided that what he wants is not
> covered by Part 97, so self-policing doesn't apply. This country

You have decided that, based on what I _believe_ to be faulty
reasoning. As stated in a previous message to Phil, the FCC can and
does take action against ANY type of license held by a person found
guilty of an infraction of any of their regs. So what's wrong with
advising a fellow ham that he _might_ lose his amateur privileges if
the action he is contemplating is not legal?

I've worked on newspapers on and off since 1959 & I would like to
come to their defense, but I can't. I have had stories screwed up
beyond belief. There a a few real pros that get it right. But the
younger generation for the most part have a bang up journalism education
and don't know come here from sic em about the rest of the world.
The ones I have met don't care to learn either. I have been in on
a couple of national stories and they bore almost no resemblance
to the facts. This is in newspapers and they are 10 times better
than TV.

Thanks to Robert Casey N6UBM for posting the description of a Two Meter J-Pole.

I have several questions on this antenna that he or someone else might answer.

1. How much power could one push into this when made out of twinlead?
Would 5 watts be OK? How about 10?

2. How do you tune it? Trim the top?

3. Can you build this upside down? I.E. Feed it from the top, weight the
bottom, and hang it out the window by the coax?

adTHANKSvance,
-edg

2222. MONTHLY SOLAR TERRESTRIAL REVIEW

Newsgroup: rec.ham-radio
Date: 1990-10-20 04:06:08 UTC
From: std_oler@HG.ULeth.CA
Message-ID: <901019220608.2400494c@HG.ULeth.CA>
Source record: 7432

--- MONTHLY SOLAR TERRESTRIAL REVIEW ---
September 1990

Report Issued from Data Released by the
Space Environment Services Center
Boulder Colorado

MONTHLY ACTIVITY SUMMARY AND SOLAR CYCLE OUTLOOK OCTOBER 1990 - APRIL 1991

We are now in month 49 of solar cycle 22. Average activity levels and solar indices fell dramatically in September when compared to the August averages. Daily values for the 10 cm solar radio flux, sunspot number, and sunspot area fell by nearly 50% in some cases. In particular, the average 10 cm flux fell by over 45 points to 175.8, the average sunspot number fell 83 points to 186.4, and the average sunspot area was less than half that of August (6,933 million square kilometers [4,333 mil. sq. miles] in August compared to 3,399 mil. sq. kilometers [2,124 mil. sq. miles] in September). This sharp drop in activity averages resulted in a 0.8 drop in the smoothed sunspot numbers for March 1990 from that of February, a similar drop in the smoothed 10.7 cm flux was also noted. The decrease in the smoothed sunspot numbers has turned the prediction model downward again. It is now very unlikely that we will see activity of sufficient magnitude for a sufficient length of time to change the cycle maximum of July 1989. This being the case, solar cycle 22 will go on the record as the shortest rise to maximum ever recorded (only 34 months).

Flare activity was low to moderate during September. Sixteen M-class flares were reported during the month, and of these, only one reached M5 strength. It was an M5/1B from Region 6272 at 21:56 UT on 17 September. In addition, Region 6272 produced two smaller M-class flares earlier on the 17th. The only other Regions that produced more than one M-class flare during the month were Region 6233 and Region 6266. Region 6233 was August's most active region. During September, it produced four M-class flares before crossing the limb. Region 6266 produced only two M-class flares.

Satellite level protons remained at background levels throughout the month.

Geomagnetic activity was mostly unsettled. There were nine days of active conditions at middle latitudes and six at high latitudes. High latitudes also experienced five days of minor storm conditions and one of major storm conditions. This activity is believed to be more in response to coronal hole and disappearing filaments than to solar flare activity. Although the long duration M3/SF on 14 September may have contributed to the geomagnetic activity

on 18 September. Likewise the M5/1B major flare of 17 September may have contributed to the activity of 21-22 September.

Early outlooks showed a pulse of activity in September or October with a low around the first of the year followed by a second pulse of activity about April 1991. However, the uniqueness of cycle 22 with its earlier than predicted sunspot maximum and earlier than predicted pulse of activity may indicate that earlier outlooks of future pulses may also be late by several months. The cycle is still expected to contain a relatively flat peak through 1991 (with a slow decline), which would indicate that solar activity throughout the coming year will likely have several bursts of high activity with increasing periods of low activity occurring as the cycle begins to wind down.

Geomagnetic conditions will also contain spikes of activity occurring throughout the coming year due to solar activity and coronal holes, which are showing signs of stabilizing somewhat, in recurrent patterns. The probability of major geomagnetic activity being attributed to strong solar flares is steadily decreasing as the number of flares capable of producing terrestrial impacts also begin to decline. Most of the future magnetic activity will likely be caused by coronal holes and disappearing filaments (as was observed during September).

Radio propagation conditions over the coming year will, likewise, experience brief periods of poor to very poor conditions due to the magnetic and periodic solar activity. Overall, however, radio propagation conditions are expected to remain very good over most paths as sunspot numbers continue to remain elevated over the next year or so.

Sep: 186.4 124.7* .67* 175.8* 15*

* = Preliminary estimates

The lowest smoothed sunspot number for Cycle 21, RI = 12.3, occurred in September 1986. The preliminary sunspot maximum for this cycle (cycle 22) remains July 1989, with a peak smoothed sunspot number of 158.1.

SUMMARY OF GEOMAGNETIC ACTIVITY FOR SEPTEMBER 1990.

Global geomagnetic activity peaked on 12 September with an estimated planetary A-Index value of 24. On that day, the eight estimated planetary K-indices were (starting at 00 UT): 5, 4, 3, 4, 3, 3, 3, 3. High latitudes experienced the most severe geomagnetic activity, reaching major storm conditions on 11 September. The magnetic observatory at Anchorage Alaska recorded an A-Index of 50 on 11 September. The eight K-index values for Anchorage were (starting at 00 UT): 3, 3, 5, 7, 6, 5, 4, 4. Middle latitudes closely followed the planetary figures throughout this period, implying that the strong geomagnetic activity remained confined to the high northern latitudes.

Global geomagnetic activity reached it's lowest value of the month on 30 September, with an estimated planetary A-Index of 6. Estimated planetary K-Index figures for this date were: 2, 0, 1, 1, 2, 3, 2, 2. Middle latitudes had K-Index figures slightly below these values, while high latitudes had figures slightly above these planetary estimates.

NOTES:

- Xray Flare Classes (weak to strong): C, M, X (with sub-categories rated from 0.0 to 9.9 in each class).

- Optical Flare Classes (weak to strong): S, 1, 2, 3, 4 (with an attached figure identifying brightness: F-Faint, N-Normal, B-Brilliant).

- Locations are given in latitude and longitude as measured from the central solar meridian.

- Sweep Frequency Intensity represents the intensity of detected solar radio frequency bursts (bursts sweep over large frequencies). Type II and IV almost always represent ejection of solar material through the solar corona and into interplanetary space. Intensities are rated from 1 to 3+.

2223. Re: Weird splits

Newsgroup: rec.ham-radio
Date: 1990-10-20 08:25:52 UTC
From: lauren@vortex.COM
Message-ID: <59.UUL1.3#1@vortex.COM>
Source record: 7433

In my original query about doing non-25 Khz splits for the IC24, I
was very clear about why I was interested--there are a number of open
2m ham repeaters in the L.A. area (which is extremely congested with
repeaters, but not that many open ones) which have non-standard
splits that are not multiples of 25 Khz. That's my interest.
I don't appreciate Faunt's insinuation to the contrary.

Perhaps he was confused by other people who followed up the original
thread with other desires regarding odd splits for out-of-band
operations. Such operations are of zero interest to me since I don't
operate out of band (hell, I haven't even done the well-publicized
modifications to my IC24 to transmit in the legal part of the ham
bands which it doesn't cover as shipped...)

By the way, nobody came up with a simple way of doing non-standard
splits on the IC24.

>
> WA2SRQ

The 468/f formula results in the antenna being 5% longer than in free space because of capacitive "end effects." Insulation has the effect of increasing the capacitive reactance of the wire some more (via the dielectric effect.)

But in my experience the 468/f(MHz) formula has always been about 3% long, and I doubt that the added capacitance of the insulation will make a very large difference.

So, go ahead and use the 468/f method. You will probably just trim less wire to make it resonate.

If you are using expensive wire, then add another 2-5 percent to the length, just to be safe.

>frequency ? just id on the output frequency?
>
>...Wondering

You are only responsible for identifying YOUR transmissions, the repeater
is responsible for identifying it's transmissions. YOU are only radiating
a signal on the repeater's input. This is the only signal you are responsible
for IDing. Whether the repeater retransmits your signal is immaterial.

2226. So Cal repeater stats

Newsgroup: rec.ham-radio
Date: 1990-10-20 14:34:23 UTC
From: brian@ucsd.Edu
Message-ID: <21168@ucsd.Edu>
Source record: 7436

One of the local repeater frequency coordinating committees published some interesting statistics on the number of repeaters in Southern California the other day. Assuming I copied the numbers correctly from the bulletin that was read on the air, there are 1,736 VHF & UHF repeaters and remote bases coordinated in So Cal (and quite a few more uncoordinated ones).

These break down as follows:

13 open 6m
9 closed 6m

180 open 2m
108 closed 2m

115 open 220 MHz
172 closed 220 MHz

31 open 450 MHz
488 closed 450 MHz

7 open 900 MHz
23 closed 900 MHz

21 open 1.2 GHz
65 closed 1.2 GHz

504 multiband remote base

(Note that 'closed' and 'private' are rolled together: the former merely requires club membership which is open to any applicant; the latter is by-invitation only. They didn't mention any statistics on how many there are in each of these categories.)

>From vortex!lauren@rand.org Sat Oct 20 02:14:36 1990
Date: Sat, 20 Oct 90 01:30:45 PDT
From: lauren@vortex.COM (Lauren Weinstein)

The reason I never came back is that I was very clear in my original
message. There are a number of 2m ham repeaters in L.A. with odd splits,
and I'd like to use them if possible. I don't appreciate your
public insinuation that there was something bogus about wanting
an odd split. Take a look at the repeater guide for L.A. and you'll
see that a number of the best located open repeaters use odd splits.

You may be confusing my message with some followup messages that were
from people who had clearly illegal uses in mind. In fact, I sent
one of those people mail telling them that what they had in mind
was illegal. (They basically replied that they didn't care.)

In any case, your public insinuation was out of order.

--Lauren--

Sorry, I didn't mean to insinuate ANYTHING. That was aimed at the
people who were flaming you without considering that you might have a
legitimate use for the information. My point was supposed to be that there
was a great deal of heat about your request, and almost no light.

I believe you mentioned a 6.46 split on VHF which can't be done
inside 2 meters. Yes, there are funny splits around, and weird splits
have many legitimate uses, including the one that I use that
capability for on my IC-32, that is, have the local
police/fire/whatever frequency in memory for monitoring, but have the
split set so that on key up the unit transmits on a legal but unused
frequency.

My public apologies for writing something that you misunderstood.

Source record: 7438

No, the person asking about the 6.46 split was one of those other people--I believe the person in question wanted to access a telco paging repeater with a ham HT, and it was his message that started off the "type acceptance" thread.

I never mentioned a particular split in my message, just that the oddball 2m ham repeaters in L.A. that use odd splits don't fall on multiples of 25Khz.

The repeater congestion problem is so severe around here that there is serious talk of going to a 15khz channel allocation for the ham bands.

Insulation will have a definite but neglible effect. The dielectric
constant of insulation differs from that of air, so it will have a small
impedance changing effect. It is probably less than the experimental
error in cutting the wire, or effects from how the wire is supported.

But, that is why you should always prune the antenna for best operation.

This is my signature. It doesn't contain my name at all!

] Hams have been fined by FCC for transmitting out of band under
]the relevant portions of Part 97 covering allowable frequencies. If
]you are a licensed ham and transmit outside of your allocated bands,
]you are in violation of the sections of Part 97 specifying your band
]limits. You may also be found to be in violation of other Parts.

...

]The individual in question specifically stated that he was attempting to
]use a transceiver manufactured for amateur use on non-ham repeaters.
]That is illegal on its face, unless he is authorized to use those
]non-ham frequencies by licensure or permission of a licensee in
]another service AND the radio will be certified as meeting technical
]standards for that service.

I should point out that some military services do NOT require technical certification. I use amateur equipment on CAP frequencies and National Guard frequencies - both with authorization. There is a CAP license, but no license required for national guard. Neither have technical standards. Also, the air force around here uses Kenwood ham HT's for their base commander's net.

They have. In Monitoring Times, there was some mention of a
florida law regulating scanners that exempted TV stations (but
not newspapers).

markz@ssc.uucp

2234. Re: Antenna Restrictions

Newsgroup: rec.ham-radio
Date: 1990-10-20 21:34:38 UTC
From: kjh@aludra.usc.edu
Message-ID: <12659@chaph.usc.edu>
Source record: 7444

In article <1990Oct20.194300.23704@wpi.WPI.EDU> gkd@wpi.WPI.EDU (Gregory K Doerschler) writes:
>How about this one: "No tree shall be allowed to grow that if it fell
>from its trunk would extend beyond the property line of the owner."

Greg has a very good point here, although he didn't come right out and say it. Trees very rarely fall from the base of the trunk, and likewise, towers very rarely fall from the base. A more reasonable law would limit the height to 2 or 3 times the minimum distance to the property line. The next time you drive around in an area that has had a hurricane, tornado, or just a strong windstorm, notice the damaged towers. Usually they fail near the middle; they don't come anywhere near the property line.

SB RTTYDX @ RTTYDX $RTDX1019
RTTY DX Notes 1of3 10/19/90

RTTY DX Notes for week ending 19th October 1990
BID: $RTDX1019
Part 1 of 3.

Good ideas never die. OZ3TQ has revised the idea of half speed ARQ
blocks for long haul communications. It worked this past week with
a contact with VK2SG. The link was held for some time despite some
QRM. It is worth thinking about, but it is not sure if the PK232 or
like units will work in this manner, but they are under investigation.
It is a matter of computer software. More information as further
development takes place.

Our thanks this week go to I5FLN and cluster, JA1BLV, JH1QDB, OD5NG,
TG9VT, VE3XJ, VK2EG, W2JGR, and the Tri-State DX Packet Cluster
Network. Thank you all for you information.

SB RTTYDX @ RTTYDX $RTDX1021
RTTY DX Notes 3of3 10/19/90

RTTY DX Notes for week ending 19th October 1990
BID: $RTDX1021
Part 3 of 3.

QSL Information:

UW0LZ requests his cards via Box 75, Vladivostok 690090 USSR.

8Q7DA will QSL via DL3RBF.

UI9ABV collects from Box 40/1, Tashkent, Uzbek, 700040 USSR.

5N3ETP QSL manager is N6QLQ.

ZL0AIC says to QSL via HB9AAA.

FW1FM looks at Box 20, Futuna Island for his cards.

PJ8JP allows AB1U to handle his cards.

Notes Of Interest:

Unfortunately, 8Q7DA has been and gone. He was there for only one week, October 10th to 17th.

Barbados. K4FJ and K3ZR will operate from October 20th through November 1st, signing 8P9KR and 8P9HQ respectively. QSL 8P9KR to K4BAI and 8P9HQ to K3ZR.

St Pauls Island. FP5DX and VE1KM will operate CY9SPI and CY9DX from October 20th with RTTY on 14 and 21 MHz. QSL to FP5DX.

JH1QDB, Kuni, reports that he had 929 QSOs as JD1 on his recent trip. The cards are being printed and should appear in November.

Malpelo Island. HK0TU is on schedule for November 3rd. RTTY frequencies are 1825, 3635, 7035, 14085, 21085, and 28085 KHz. QSL to HK3DDD.

Juan Fernandez. CE0ZZZ is also on schedule for mid November, according to F2JD.

ZK3KY will go QRT around October 25th. Then the chore of QSL cards
will start.

GL DE DX1

Written by VK2SG. Relayed via packet by Tad, KT7H @ N7HFZ.WA.USA.NA.
Send RTTY DX tips to VK2SG @ VK2AGE.AUS.AU.

Regarding the tower height being limited to what would not cross over a property boundry:

What is the difference between towers and trees? (Other than that trees fall much more often.)

Homeowners seem to deal with that issue without problems. Give me a 500' tower anyday over a 100' pine tree. I have never seen a tower crush a building. I have seen lots of trees.

regards,

Alan Barrow km4ba

Here is a question that several hams were discussing over
lunch:

One ham, (a contractor) indicated that you can read all your
closing documents, and still not be aware of possible covanents.
He said that most covanents were recorded on the plat for the
subdivision, and do not always show up on the deed.

He further indicated that you do not actually see a real "deed".
What you see is a warantee deed to secure debt, or something like that.

This concerned me, because if it is true, you can be legally bound
by language that you have not had a chance to inspect.

My contractor friend feels the only way to be sure is to go to the
tax office where the plats are kept, and visibly inspect the plat.

BTW, the house I bought is 25 yrs old, and I felt I had no
covanents affecting me. I do know the original subdivision
had some.

My friend thinks I may be bound by these. I felt I wouldn't, since
I did not sign anything that discussed them.

Anyone have any info on this? I suspect it may vary from state to
state.

I know there are several home that violate the orig covanents in
various ways, so I don't think anyone is enforcing them anyway.

But I would be interested in any one with information on how
they restrictions are handled.

73,

Alan Barrow km4ba

I know you've been off the air for a while, Lauren, but Southern
California went to 15khz channels in the upper two megs of 2 meters
around 1975.

They're already assigning 12.5 khz channels on 450, and 25 khz channels
on 1296.

He's right you know. CW is better than voice for working DX. The information content of a DX contact is so small that the low information rate of CW is not a problem and CW is usable at a lower S/N ratio than voice with simple equipment. My opinion is that CW is not, in general, the best way to convey information per unit time, but it is certainly useful in some situations. This doesn't mean that I think EVERYBODY needs to demonstrate the ability to work CW to get a ham license. I definitely support those who WANT to use CW to do so. I would certainly enjoy HF more if all DXers switched to CW operation. :-)

It's been my experience that insulation shortens the antenna some. It probably depends on the dielectric constant of the insulation. I don't have any pat formula.

Hey! Anyone else remember this? I remember all the OFs jamming this one.

I decided to check my QST collection from 1970.

This is from the July 1970 editorial, "It Seems to Us".

"A few young activists among us, banging the drum for complete freedom of speech, have labeled our view reactionary, out-of-touch with reality. We disagree, and suggest that more accurately it is these idealists who are the ones out of touch with reality, perhaps being too young to have learned that Utopia and practicality are not always compatible."

From the corresponce section in the November 1970 QST:

"Our rebels are gumming up the airwaves with left-wing revolutionary garbage, and the extremists of the right are fighting back with name-calling, jamming, and all the techniques they accuse the other side of using." -W8GOE

(Gee.....sounds like 20 meters 20 years later. Could it be that the "good old days" are a result of selective memory?)

Correspondence, September 1970 QST:

"I resent your slur on the name of the former Senator Joseph McCarthy. Senator McCarthy was a great American who sought to call attention to some dangers besetting the United States. He was meticulous and accurate in all of his assertions. After he was hounded to his death by the anti-anti-communist wing he was proven correct in every case, usually by admission of the persons involved." -WN6KCO

(He was pissed because the July editorial accused jammers of the student net of "Joe McCarthy tactics.")

"I'm ashamed to call you HQ men brother hams! You advise us not to discuss politics on our bands. Why? Gentlemen, we have a piece of paper called the First Ammendment." -W2OQK

Just a little trip down memory lane....

Cross-posted to: rec.radio.shortwave,misc.wanted,misc.forsale,rec.ham-radio

looking for early transistor radios again--1954-1964.

especially early transistorized AM/SW, and AM/FM/SW sets such as
the Admiral 909 All-World, RCA 1MBT6 StratoWorld Mk 2, etc.

Looking for parts for 1960 Philco T9 Trans-World. WIll take a junker.

...lots of stuff about the callsign project...

Yup, I really went and did it that time! I forgot to gently remind folks
to be sure to select all the different options. Like: TAR, CPIO, or "PURE
DATA"; compress or no compress; media, density, and blocksize (as
appropriate); insurance or not; PLEASE give me a return email address;
and also PLEASE include a self-addressed sticky label so there is no
question where to send the stuff back to.

Thanks!

I am a no-coder, and what many people seem to have trouble grasping is that we don't wish to ban or negate Morris. It is also not the reason I became a ham. I do know one no-coder who became a ham and an extra at that because he really liked HF contesting. Yes, I even have friends who think an evening at 35 WPM is fun and relaxing. They, like me, think that testing CW is not germane to the intent and purpose of amateur radio in the latter part of the 20th Century. Forty years ago, Morris was a marketable skill. Today, soldering and typing are marketable skills. If the purpose of amateur radio is to be training and self education, then the exam should reflect current technology.

I have friends that are sports spectators, some that do crossword puzzles, and by god some that are virtuosos at the key. They do these things to relax. I didn't become a ham because of Morris, in fact if there had not been no-code licencing in Europe, I may never have become a ham. When I came to the U.S., I struggled through CW to sorta painfully do 5 WPM only because I was tired of renewing my reciprocal licence and decided life would be easier with a U.S. call. Besides the problems with all the people who did not know what "G8LUK" was and thought I was a pirate or maybe an Australian station.

Yes, I did potter about on CW and worked some DX in the Novice bands. I didn't enjoy it. I don't enjoy crossword puzzles either. But you want to do CW? Be my guest. You think everyone who wants to be a radio amateur should pass a CW proficiency test so they can do RTTY with a C-64? Get real.

Its not an apartment complex or homeowners assoc, but the mobile home park
I lived in in Tempe (Tempe Cascades Mobile home Park, on University Drive)
did not allow transmitters ofany kind to be used on the park grounds.

Or, at least, that is what the rules said. They did not enforce them,
considering there were at least 3 ham antennas up and in use (only
one of which was mine :-).

Source record: 7457

```
-- MAJOR SOLAR FLARE ALERT --

OCTOBER 20, 1990

Potential Impact Forecast
Flare Event Summary

--------

MAJOR ENERGETIC EVENT SUMMARY

A major solar flare occurred at 18:06 UT on 20 October. The flare was
rated a class M8.5/1N event (quite powerful) and was produced from Region 6311
at location N15W82 (latitude, longitude from the central solar meridian). The
flare officially began at 17:53 UT and ended at 18:12 UT (relatively short).
The event was accompanied by strong radio bursts at high frequencies, but very
weak bursts at low frequencies. A fairly weak shortwave fade was observed
during this event. Post flare loops became visible at 18:41 UT and continued
in progress for a couple of hours after the event.

No further major flares are anticipated from Region 6311 before it passes
beyond the western limb in 24 hours. However, there is a risk that this region
will produce a low to moderate level M-class flare before it's passage beyond
the western limb. Probabilities for flare activity over the next 72 hours
(from 21 October to 23 October) are:

Class M Flare: 45%
Class X Flare: 05%
Proton Flare: 05%

POTENTIAL TERRESTRIAL IMPACT FORECAST

The major flare is not expected to produce a terrestrial impact with the
Earth. Although the flare was certainly powerful enough to cause a strong
impact, it's position on the solar disk (far on the western limb) is too far to
cause any significant impacts.

However, although this major flare is not expected to have an impact with
the Earth, another solar event very well could have a moderate impact with the
earth. A large 30-degree long solar filament located between N48E01 and N32W23
disappeared sometime between 15:13 UT on 19 October and 00:58 UT on 20 October.
This event is expected to produce an increase in both geomagnetic and auroral
activity within the next 48 hours. Radio propagation conditions will likely
also become somewhat degraded at that time. For more information regarding
this event, see the Solar Terrestrial Forecast and Review for 20 October.

** End of Report **

The first time I bought a house and discovered this, it was mind
boggling... someone 20 or more years ago decided on certain uses
for the property, and that remains in effect FOREVER, even though
they don't own it anymore...

incredible.....

--- SOLAR TERRESTRIAL FORECAST AND REVIEW ---
October 20 to October 30, 1990

Report Based In-Part from Data Obtained from the
Space Environment Services Center
Boulder Colorado

SOLAR TERRESTRIAL REVIEW AND SHORT-TERM FORECAST

By far, the most interesting day of the week occurred on 20 October when Region 6311 (N15W90) produced a major class M8.5/1N flare at 18:06 UT. This event was relatively short lived, lasting only 19 minutes, but produced some strong high-frequency radio bursts along with a relatively weak short-wave fade. Post flare loops became visible at 18:41 UT on 20 October and continued in progress for several hours after the event. This same region was also responsible for producing a class C8/SF flare at 05:10 UT on 20 October.

A large 30-degree-long solar filament also disappeared on 19/20 October. This filament was located between N48E01 and N32W23. It vanished from this location sometime between 15:13 UT on 19 October and 00:58 UT on 20 October. This event could have a potential impact with the Earth within 48 hours.

Geomagnetic activity varied from quiet levels to minor storm levels. The most active day of the week was 15 October, when middle latitudes experienced unsettled to active conditions with several brief bursts of minor storming. High latitudes remained mostly active with periods of minor storming. Activity then became quiet until 20 October, when another brief period of minor storming occurred at both middle and high latitudes.

Auroral activity was not visible during most of the period at low and middle latitude locations. High latitudes, however, witnessed periods of low to moderate auroral activity, particularly on 15 and 20 October.

Radio propagation conditions were, for the most part, good to very good throughout the week. The only exception was 15 October when high and northerly middle latitudes experienced degraded conditions due to geomagnetic and auroral activity. Low latitudes have maintained mostly good to very good conditions throughout the week.

Solar activity is expected to quickly become low as Region 6311 rotates beyond the western limb within the next day. Before this occurs, however, there is a slight risk of a low to moderate level M-class flare from this region. Accompanied with this risk is the potential for related short-wave fades. However, any short-wave fades occurring over the next 24 hours (until approximately 22 October) will be of low-intensity and relatively short

duration. No further major flares are anticipated from Region 6311 before it rotates beyond the western solar limb.

Geomagnetic activity is expected to become unsettled to active with a risk of storm conditions (particularly at high and northerly middle latitudes) between 21 October and 23 October due to the recent large disappearing solar filament. No effects from the major flare are anticipated due to its location on the solar disk. The solar filament which disappeared was located relatively far north and may not produce significant geomagnetic activity. However, the risk for potential storm conditions cannot be entirely dismissed. Determining the potential impact of such events can be quite difficult and elusive. Current models suggest that the filament impact will probably be only modest.

Auroral activity is also expected to increase in tandom with geomagnetic activity. High latitudes could experience moderate to possibly periods of high sporatic auroral activity. Present models indicate that high-latitude activity will likely only reach moderate levels. Middle latitudes will witness mostly low to sporatic moderate auroral activity. Low latitudes will be unable to spot any auroral activity.

Radio propagation conditions may become degraded as effects from the disappearing filament engulf the Earth. Propagation at high latitudes is expected to become poor to very poor until approximately 24 October when conditions should again return to near-normal (fair to poor). Middle latitude paths may suffer fair propagation conditions on 21 - 23 October. There is a risk that middle latitude propagation will become fair to poor until 23 October, depending on the severity of the impact from the disappearing filament. Current models, however, suggest that propagation will be confined to fair conditions over middle latitude paths. Low latitudes will likely maintain good to very good propagation conditions throughout the next week. No significant impact is expected with low latitudes, although some slight decrease in propagation quality may be noticable until 22 or 23 October when conditions should return to normal or above normal.

SIDE NOTE: Potentially good to very good Meteor Scatter propagation should be possible in the evening and early morning hours of 21 and 22 October. The Orionid meteor shower peaks on these days and usually produces approximately 20 to 25 meteors per hour. Meteors should increase in frequency after the midnight hours.

SUMMARY OF ALL ACTIVE REGIONS VISIBLE ON THE SOLAR DISK AS OF 20 OCTOBER

| Conditions | Given in 3-hour intervals | Intensity |
|___________________________________________________________________|
```

NOTES:
This graph ONLY depicts geomagnetic conditions observed at Boulder, Colorado for the past 87 hours. Conditions to the north of Boulder will generally have slightly higher activity than Boulder, while conditions to the south of Boulder will likely have lower activity than those depicted here. However, the plots should present a good approximate average of planetary geomagnetic conditions.
"Anomaly Intensity" is meant to represent nothing more than a very rough guide to the --potential-- interaction geomagnetic fluctuations --might-- have on earth-based systems sensitive to magnetic fluctuations (ie. electrical power distribution networks, telecommunications networks, etc.).
For radio signal propagation purposes, plot lines are approximately

proportional to propagation quality when plot lines are below Minor Storm conditions. Propagation quality may deteriorate rapidly (ie. non-proportionally) when plot lines reach or exceed Minor Storm levels. Complete radio blackout conditions on all short-wave frequencies may occur if plot lines reach or exceed Severe Storm levels.

PLANETARY 10-DAY GEOMAGNETIC ACTIVITY OUTLOOK (21 OCTOBER - 30 OCTOBER)

| Conditions | Given in 8-hour intervals | Intensity |
|_____________________________________________________________________|
```

NOTES:
Predicted geomagnetic activity is based heavily on recurrent phenomena. Transient energetic solar events cannot be predicted reliably over periods in excess of several days. Hence, there may be some deviations from the predictions due to the unpredictable transient solar component.

|----------------|---|---|---|---|---|---|---|---|---|---|
| AURORAL |Sun|Mon|Tue|Wed|Thu|Fri|Sat|Sun|Mon|Tue|
| INTENSITY | Eve.Twilight/Midnight/Morn.Twilight |
-------------------------------------------------------

NOTES:
Latitudinal boundaries are the same as those given above for radio
propagation quality. Periods of high auroral activity may be suitable for
```

auroral-propagation. Locally visible moderate auroral activity will almost always cause moderate to strong deterioration in HF signals, while locally visible high auroral activity will render most HF bands useless.

Auroral activity is defined as follows:

NOT VISIBLE: Not visible

LOW: Diffuse, inactive auroral activity visible very near the northern horizon for mid and low latitudes.

MODERATE: Visibly active, but not exceptionally bright auroral activity most visible above the northern horizon for mid to high latitudes. This type of activity usually encompasses torch-like (or beam-like) aurorae mixed with low-intensity curtain aurorae.

HIGH: Visibly very active, with periods of bright, pulsating curtain aurorae possibly mixed with moderate intensity zenith aurorae. Can occur to the north as well as stretching up near the zenith, particularly at middle latitudes. There may be some color fluctuations discernable.

VERY HIGH: Very active, very bright and very colorful auroral activity possibly mixed with intense zenith and curtain aurorae. Visibly strong pulsations with auroral boundaries to the zenith, stretching even partway to the southern hemisphere of the sky.

EXTREMELY HIGH: Rare, incredibly bright auroral activity with rapid color and brightness fluctuations mixed with very strong rapid auroral pulsations visible throughout the entire sky.

There are three plotted lines per day in the auroral activity prediction charts. Each of these three plotted lines represent three periods during the evening/morning when auroral activity can be seen. The first line represents the evening twilight period. The middle line represents the --local-- midnight sector, while the last line of each day represents the morning twilight period.

The auroral activity predictions charts are heavily based on recurrent phenomena and may not be accurate in the longer-term due to unforseen and unpredictable transient events (ie. such as solar flares).

The visibility of auroral activity depends on your location and the brightness of the sky (which is dependent upon both city lights and lunar phase). These charts do not account for these variations. The charts are based on dark-sky conditions (lunar phase excluded). Aurorae occur independent of sky brightness, so just because auroral activity may not be directly visible (due to lunar phase, for example) does not mean auroral activity isn't in progress.

2252. CBS irresponsible nothing new

Newsgroup: rec.ham-radio
Date: 1990-10-21 15:28:00 UTC
From: SPADGETT@AUDUCVAX.BITNET
Message-ID: <9010221311.AA16294@ucsd.edu>
Source record: 7462

Here are a couple of historical references that may be of use
to the current discussion on the responsibility factor of CBS
network. (This may be similar to throwing gasoline on a fire.)

In 1969, CBS aired a program called HUNGER IN AMERICA. The program
opened with a dramatic rescue attempt in a San Antonio hospital of
a small baby. The program stated that this child, like many others
in America died because of hunger. WRONG! The child's parents were
well-to-do and the child was very premature. Hunger or malnutrition
was not a factor in this death.

In 1971, CBS aired the program THE SELLING OF THE PENTAGON. The pentagon
charged that CBS took the answers to one question and re-arranged them
to form the answer to another question. This process made the pentagon
appear in the worst possible light. On investigation, it was discovered
that the pentagon secretly videotaped the interviews, also. The "secret"
video tapes proved that CBS had altered the responses in order to make
the program more sensational.

Remember the 1968 Democratic Convention in Chicago? There is lots
of evidence that CBS news crews were staging confrontations between
police and protestors.

Remember Dan Rather's faked trip into Afghanistan?

CBS has a long history of distorting the news. If you want to call
CBS irresponsible, you will have to stand in a long line to do so.

You can do the following: specify in your written offer that it is
contingent on your approval of the CC&R's. Further specify that
the seller must deliver them to you by specified date for your
approval. I've done this - it works.

The question you ask is backwards. WHY do people want to broadcast their
private lives to everyone withing two miles? What makes people think that
what they broadcast is stopping at the edge of their property?

Your question is a lot like asking "WHY do people want to keep and
bear arms?" Not everybody does. But, the Constitution says it is our
right to do so if we wish. I very much like the description of the
airwaves from "The Capitalist Manifesto", which says the airwaves are a
limited resource that belong to everyone. This is the basis for TV/Radio
licenses, which are (supposed) to be granted to the station "as a public
trustee". They were not given the air, they were 'loaned' it, to use in
our interest. Those frequencies being used by my neighbor are not his
personal airwaves. They are mine, too.

You might claim users of baby monitors do no know what they are doing.
True. But, it is not illegal for me to buy a piece of apparently
worthless property from someone who doesn't recognize gold bearing quartz
when I do. He lost because he didn't know what he was doing. I gained
because I did. "Baby monitor" gave up personal information because he
doesn't know what he is doing. I gain because I do.

This is my signature. It doesn't contain my name at all!

Just wanted to comment on a few things:

1) Just worked the JOTA (Jamboree on the Air) for a local Boy Scout Group. Had a lot of fun, made about 12 QSO's in 3 hours (which is good, considering that usually I made a contact, and then handed the mic around the room) and even hit K2BSA/1. Was searching for DB0BS(something), the German station, but missed it. Oh well... The kids had fun, and I think with a little work, three of them might be Novices soon (which is one reason I like doing the JOTAs). I remember meeting a ham on Field Day in 1978, when I was still a Scout myself. He had set up at a local camporee, and was having the time of his life. That got me started in this crazy hobby, and it's fun to pay back a bit. Anyone else work the Jamboree? What did you think? I found that with so many high-pitched voices, I had trouble zero-beating..... I kept thinking that I was off, since the voice was so high...

2) I have an Alinco DJ-160 HT. I've never had problems with intermod, but the manufacturer lies about wattage output. I have both the EB-10 (rated .2/2.5 watts lo/hi) and the EB-12 (rated .5/5 watts lo/hi) and have found the real output to be about right at the low level, but about a watt less in both cases at the high level. Not too badly off, but still less than I was expecting. I'm still looking for the MARS-CAP mods for this radio, though.... anyone have them (forlorn hope)?

3) What defines "Type-accepted"? Our local Civil Defence group has considered using ham radios because in our experience, they are better radios. We hooked up a Kenwood 231 and a Motorola both txing in the public service bands, and compared them. The Kenwood was easier to use, suffered less intermod (a problem here, since our antenna is 20 feet from the County Police antenna), and according to the spectrum analyser, had a "cleaner" signal! (-43dB reduction for the Kenwood, vs -21 for the Motorola). Also, they're cheaper, in general. If we could get a crystal controlled Kenwood, we would buy it in a second!. As it is, we just look at them and sigh.

Well, I've taken up enough bandwidth for today.

> Let's not nitpick. You know and I know that the issue is USING
> the radio to TRANSMIT out of band. That is a reasonable presumption
> of the intent of a transmit mod.

I modified my radio to transmit out of band, with the intent of (but NOT
on a regular basis) to be able to transmit out of band. That is a simple
enough conclusion. But the intent was not to do anything illegal, since
there exist more than one legal case of transmitting out of band (IMHO).

I just want to make sure someone doesn't suggest that the POSSESION of
radio so modified be made illegal just because they have not considered
the LEGAL reasons for transmitting out of band. clearly if there comes
to be a law making it illegal to posses equipment capable of transmitting
on any frequency you don't have a license for (aside from part 15 devices
and such) there could be many problems with, such as making illegal those
devices intended for other than over-the-air transmission, like the drivers
for transverters. You COULD do something illegal with it, and you COULD
do something legal with it.

> Hams have been fined by FCC for transmitting out of band under
> the relevant portions of Part 97 covering allowable frequencies. If
> you are a licensed ham and transmit outside of your allocated bands,
> you are in violation of the sections of Part 97 specifying your band
> limits. You may also be found to be in violation of other Parts.

And I believe that, in the intended circumstances, that 97.403 can in
fact make out of band transmission "legal". But if there is any doubt
about the proper application of 97.403 in any circumstance, you can bet
that a court will be making the actual determination. The FCC could
very well take someone to court and argue that the circumstance were
not what 97.403 was meant to cover. I am not certain just what they
were intended to cover, but I have some ideas.

> > > Remember that this whole thing got started by somebody who

> That is illegal on its face, unless he is authorized to use those
> non-ham frequencies by licensure or permission of a licensee in

> another service AND the radio will be certified as meeting technical
> standards for that service.

But there exist certain "legal" uses. I suggest people not be so quick
to say things like "what you plan to do is illegal" but rather examine
it closely and if you must say something, say things like "I'm not sure
what you intend to do, but I'd like you to be aware that this mod readily
allows you to do many illegal things. I hope your intended use is legal".

> > Unfortunatley, we have already decided that what he wants is not
> > covered by Part 97, so self-policing doesn't apply. This country
>
> You have decided that, based on what I _believe_ to be faulty
> reasoning. As stated in a previous message to Phil, the FCC can and
> does take action against ANY type of license held by a person found
> guilty of an infraction of any of their regs. So what's wrong with
> advising a fellow ham that he _might_ lose his amateur privileges if
> the action he is contemplating is not legal?

There's nothing wrong with it. I just don't believe it falls under the
concept of hams self-policing their own service. A case in point could
be Captain Midnight's adventures with HBO's satellite feed. I doubt if
he would have listened, as I am sure he knew it was blatantly illegal.
Still, it would be OK to have advised him not to do it (had you known him
and known he intended to), but it would not really have been a part of
ham self-policing. It's just the same as telling anyone not to do anything
that is illegal.

If your neighbor just does not like your tower or antenna, for whatever
reason, and talks to his lawyer, then the game suddenly changes because
the lawyer will think of checking on the CCRs. That's his job.

> >The problem is that both of these routes are expensive, risky and can

>
> The other practical aspect of homeowner's assn enforcement is that
> most of them are flat-broke. The legal strategy is to get your lawyer
> to file expensive and time-consuming motions until their money runs out.

It's going to cost YOU a lot of money to have your lawyer do all these
things (in the usual cases). The association might well be paid a lot
of the money by the complaining neighbor(s). And they would stand a
lot better chance of recovering their legal fees should they prevail
than you would if you prevail. Your lawyer can give you the proper
details if you encounter this situation.

> >I am not a lawyer. These are just my opinions. Your mileage may vary.
>
> I'm not a lawyer, either. These are just some personal observations
> from another ham stuck under a CCR.

Most of us aren't, unfortunately (or maybe that should be fortunately).

> I wonder now if, because the antenna clause was abandoned on my CCR on
> enforcing the HF6VX on the ground, I can now put up a "real" antenna on
> top of the roof. (heh, heh, heh.)

Speak to your lawyer. Talk with him about:

- Recording some evidence about the existance of your present antenna and
the time period it has been up.

- Checking with what laws might be applicable whereby you could have the
actual CCRs removed by court order on the basis of abandonment of the CCRs
before putting up the bigger antenna.

Im looking for information on the above units besides the few lines
mentioned in the various SW/Ham catalogs. Things like grey/scale or
B&W fax, ect....

Perhaps the most important thing im looking for is software to run
any (or all) of these on an Amiga. If im reading the few lines correct,
all can use a simple terminal program for the various modes except Fax.
So does anyone use any of these with an Amiga or know of software to
use them with an Amiga that will receive -all- modes?

On the same note, do any of them supply information so that I could
write my own?

> My friend thinks I may be bound by these. I felt I wouldn't, since
> I did not sign anything that discussed them.

There may be language in what you did sign that binds you to them and it may not even be obvious.

When you are contemplating a house purchase, discuss with your lawyer just want you want. You might add clauses (have your lawyer write them) making the deal void should certain things turn up. Real Estate lawyers should know all the places to look for where the covenants can be registered. It would ultimately be your responsibility to look them up.

> Anyone have any info on this? I suspect it may vary from state to
> state.

It definitely does vary from state to state. As for general info, you could read through the books and study guides on real estate sold in the academic bookstores serving the nearest college/university law school. I have found the Nutshell book on real estate law rather interesting. It covers a lot of the conceptual things that would generally differ fron state to state, but only in detail (such as number of years for abandonment of a covenant).

> I know there are several home that violate the orig covanents in
> various ways, so I don't think anyone is enforcing them anyway.

That can be evidence of lack of enforcement; meaning you might get away with it. It is not going to generally be of any use in your defense unless it is the exact same covenant, and then your lawyer is going to have to be good at his job to connect the applicabilities.

> You are evading my question. WHY do people want to listen to baby monitors,
> cordless telephones, etc.? WHY do people want to pry into other people's
> private lives? Hang the legalities. What is the motivation to do it, legal or
> not?

Jim, you are asking questions about MORALS. There may be as many different answers as there people asked.

It's OK to ask questions about MORALS, but I don't have to answer if I don't want to. It's OK to ask what I do in bed, but I don't have to answer if I don't want to. I don't want to answer either question.

I hope your question on morals has ABSOLUTELY NO CONNECTION whatsoever to the LEGAL issues. I for one don't want to see ANY law based on morals. The main reason for this is that there are SO MANY DIFFERENT systems of morality to choose from.

I can imagine many reasons why people might listen in on radio transmissions. I can imagine many reasons why people might open the envelope containing the pictures of you and your significant other in bed together.

Yes, Jim, I *AM* EVADING your question. The reason is because no matter what the answer is, or who answers it, it is NOT RELEVANT.

I am only interesting in making/keeping such listening LEGAL so that the MORAL issues don't have to come into play as arguments, so that we don't have to deal with the conflicts that would arise out of the differences in moral beliefs we all have.

Isn't it strange that so MANY issues all come down to someone questioning someone ELSE's moral beliefs? Can't we all just live together despite our individual differences without having to question, judge, push, pull or promote any of them?

Source record: 7475

Suppose I need to QRO to 800 watts in a quad yagi array to hit a repeater many many miles away. What if I then QRP to 10 milliwatts to ID? The FCC might well be listening to my 800 watt signal and not be picking up the 10 milliwatt one. Have I LEGALLY ID'd?

I don't know.

I personally consider it important that my ID have basically the same coverage as my just recent transmission.

However there do come to be circumstances where one just cannot ID because they cannot transmit without also causing interference (which would technically be intentional because you know it would interfere). I would personally prefer to avoid the interference. In such cases one might have no opportunity to ID at all within a limited time frame.

When it is clearly such a case, I suppose going QRP enough that you are confident you will not cause interference is as good as you can do then. But it should not be used when a full ID clearly is possible, nor to make your transmission effectively anonymous for part of the coverage.

If you ID QRP and then get back into the repeater QRO, you should ID again to make sure your transmission is ID as well as possible. I believe it is unfortunate that the FCC regulations really do a poor job of defining this.

> 65 closed 1.2 GHz
>
> 504 multiband remote base

If Communicators are limited to 220 MHz and above, most are going to end up on 440 MHz because of the equipment availability. This is going to wreak havoc with the 440 MHz private repeaters. The closed club repeaters would be a significant problem as long as the clubs don't practice any discrimination on the basis of license class.

I would suspect that most of these repeaters are controlled by CTCSS or DTMF access. With virtually all new radios having CTCSS tone generation capability for all standard tones, those repeaters controlled by CTCSS are going to end up being accessed anyway. The DTMF controlled ones with short access codes could see the same problems.

This will, unfortunately, also create even more bias against Communicators as a whole for the actions of likely just a few.

From the looks at the above stats, the 70cm band is just as crowded as the 2m band in major metroplitan areas (i.e. FULL). Every argument that uses fullness as a reason to exclude Communicators from 2m is just as applicable for 70cm. The only difference is that there are FEWER open repeaters on 70cm.

Maybe having Communicators on the "full" 2m band would cause problems. But squeezing them all (and this is where they would go, mostly) onto the "full and closed" 70cm band will just be worse.

The argument in the rural areas is different, since 2m is the primary band everyone uses and 70cm is used, but not by nearly so many.

This matter alone justifies allowing Communicators on 2m and 6m. Maybe it is not too late to file a petition to amend comments to the FCC in the Communicator issue.

> (Note that 'closed' and 'private' are rolled together: the former merely
> requires club membership which is open to any applicant; the latter is
> by-invitation only. They didn't mention any statistics on how many there
> are in each of these categories.)

It would be nice to see those differences. Maybe someone can encourage them to break the stats down a little better.

2267. IC-24AT extended frequency coverage?

Newsgroup: rec.ham-radio
Date: 1990-10-21 23:40:25 UTC
From: endelman@wellworld.Sun.COM
Message-ID: <1588@exodus.Eng.Sun.COM>
Source record: 7377

I just bought an ICOM IC-24AT 144/440 HT and am enjoying it a lot. I'm told that there's an (undocumented) way to program it to increase the VFO range and also to make it possible to tune in 10 and 100 MHz increments. The instructions I was given are:

```
From power off, hold down then turn radio on to enable
======================== ============================
LIGHT, B, 3 extended VFO range
LIGHT, 2 10 MHz tuning increments
LIGHT, 3 100 MHz tuning increments
```

Unfortunately, nothing changes when I try these! Has ICOM removed this goody in the latest units they're shipping, or am I just not doing it right? Anybody know?

Thanks,

Aaron

From: JARVIS AT DGAESO51
To: EARN::"info-hams@ucsd.edu"
Subj: SONY ICFSW7600 radio
I just bought a new SW radio in Hong Kong a few weeks ago. It is made by
SONY and has the model number ICF-SW7600. It appears although I am not
sure to the the replacement for the fairly well known model ICF-7600D
which has been around for a few years now since it is about the same size
and appears to have similar capabilities. However this radio
from a features point of view at least has several nice improvements over
the ICF-7600D that I wished it had since I have owned one of these for
several years.

These are what the new radio has that the 7600D did not.
1) BFO for USB and LSB.
2) On FM you get stereo(!) on the phones. Not on the internal speaker
since there is only one.
3) It has a dial light that stays illuminated for about 15s after
pressing it.
4) It has a well deswigned pull out stand on the back which lets it
rest at a very convenient angle for use (very stable too).
5) It has a lock feature which disables key presses.

All these are improvements over the 7600D.

Performance wise. I have not tested it closely but at first sight
and after having it for several weeks now I would say it is about
as capable as the 7600D.

Cost me US$165.00

2271. Re; the decline of CW

Newsgroup: rec.ham-radio
Date: 1990-10-22 12:51:14 UTC
From: szarekw@LONEX.RADC.AF.MIL
Message-ID: <9010221251.AA01847@lonex4.radc.af.mil>
Source record: 7381

hello Randall,

Welcome to the world of radio.

Just because you think that CW is not "a medium that is suited to mobile operation". does not qualify it as a fact, nor is it a reason for its lack of popularity. I have a mobile hf rig and my log shows almost 80% CW contacts. I find CW is a digital mode with a low data rate that is easy not as prone to noise interferance as is any type of phone communication. Sending CW is VERY easy with a keyer and again there is no mobile noise. And finially CW is easy to copy if you take the time to learn it.

Ah ha maybe that is the reason for all the code bashing, it isn't hard in itself, but it takes time and dedication to learn to use it as well as we use our mouths. Time and dedication are two things that (some, a few, most [insert your favorite]) people are not willing to devote to anything. It is easier to be lazy. The reason for the no code licence is to allow those with no interest in CW to participate in the parts of amateur radio that don't make use of code. I have no problem with that, however, dont you dare suggest that cw operation is simply part of a bye gone era. It happens to be the most enjoyable part of this bloody hobby for many of us. CW is not less popular, the CW bands are just as crowded as the SSB bands and the bandwith of a CW signal is less than that of a side band signal! So before you get off suggesting in an open forum that CW is not popular and that In the future it will continue to "decline in popularity" because "times are a-changin" I strongly suggest you pull your head out of the sand and look at what you are saying. If we, any part of the amateur community begins suggesting that we do not "need" a portion of our treasured frequency space then we will have it taken away by someone who can demonstrate a "need". I am an advocate of anything that is Pro-ham, I don't care if it is code or no code. As long as it does not even hint at the possibliliy or render a suggestion that something may be taken away from us and not be missed.

Someone on the net posted a Mod for the 24SAT and mentioned something about
if the HT is of the earlier versions, in addition to the keyboard sequence
reset, a diode had to be removed. The Keyboard sequence alone din **not**
work. Does someone on the digest know exactly what diode has to be clipped ??
Any help on the matter is appreciated.
73,
Rich

>
>I wouldn't have thought so either, but...

Ditto reports of "mobile" during CW contacts. They are out there, you
just have to listen (at 20 wpm :-o) for them !

The relative inefficiency of mobile antennas on the lower frequency
bands also gives CW an advantage over SSB. The radiation resistance of
an 8' whip on 80 meters is less than one ohm. This pretty much wipes
out your transmitter's 100 watts. The receiver is unchanged, because
the signal and noise are both attenuated equally.

Source record: 7387

>I am studying for my ham license, but I am confused by grounding.
>
>What is the difference between RF ground and electrical ground?

RF resonates wires whose length is an integral multiple of a
quarter wavelength. If you DC-grounded a transmitter with a
resonant wire, the average (DC) voltage of the transmitter would
indeed be zero.

One other cute trick of transmission lines is that short circuits become
open circuits at each quarter wavelength. If you've grounded one end of
the line, then it's an open circuit one quarter wavelength away. Poof.
No ground. (This is Smith Chart magic - ask an EE prof.)

>What kind of problems can arise if you have an electrical ground but
>not an RF ground?

Your transmitter/coax/whatever will have RF on it. In small quantities,
this is no big deal. I've been bitten by RF before - it burns small
holes in your skin. Smells bad. The other problem is that it couples
with nearby objects, like your cat, which makes tuning impossible. It
can also annoy the cat. If you don't have a cat, think about your
neighbor's TV instead.

>I know how to construct an electrical ground, but how do you construct
>an RF ground?

An RF ground is usually either a short (<<1/4 wavelength), or otherwise
non-resonant wire. For multi-band operation far from a Real(tm) ground,
several different lengths are used to connect the transmitter to ground.
If any one of them is a short circuit, zero ohms in parallel with
anything is still zero ohms.

>Finally, I see that MFJ sells an artifical RF ground box. How does one
>connect that? I.e., if you connect an electrical ground to the ground
>terminal of a transceiver, where does the RF ground connect (and I
>guess, what does it do)?

The artificial RF ground puts the RF onto a length of wire, rather than
onto your transmitter chassis. It sets up an equal and opposite current
in the wire, cancelling out the RF that was on the transmitter case.

The electrical ground is needed for 60 Hz safety. The RF ground is
needed for RF safety. Put both the electrical ground and RF ground on
the same ground terminal of the transmitter. I'm not sure about MFJ's
version - consult the owner's manual.

>Many thanks.

No problem. Hope you get your license soon. Good luck !

>Got any experience or ideas?
>73, ted
>n6trf

There was an article in one of the last Ham Radio (snif) editions. It described converting a TV LPDA to a 5-element 2 meter Yagi. I took it at face value and did it. Worked (sorta). I looked at some other equations, scaled for the different element diameter, and now have an operational 2 meter Yagi.

Yagis are a little squirrelly around metal objects, so maybe the answer is to leave it an LPDA, but prune it for 2 meters.

>C-64? Get real.
>--
>Julian Macassey, n6are julian@bongo.info.com ucla-an!denwa!bongo!julian

I take your point that CW may not be everyone's interest. The
conclusion, however, does not follow that CW should not be an entry
requirement. Think for a moment about what the CW requirement is, in
general terms: it is a test of on-the-air procedures. This sense has
been lost somewhat since the elimination of the transmitting test.

So, what should take its place ? More technical exams would ensure we
have lots of techies that don't know procedure. Giving, say, an RTTY
test would then generate no-RTTYers, complaints that RTTY is obsolete,
etc. Because amateur radio is so varied, an operations test on any
particular mode would generate grousing from other groups. Giving
several different operations tests would be a VE's nightmare.

CW is probably more common to all amateurs than any other particular
mode. One could argue that this is *because* of the international
CW requirement. Yup, that's right. Think of CW as having the same
function in amateur radio as American English has in the US. It's the
"watering hole" where the packeteers can meet the FSTVers.

So, I suppose it is up to the no-coders: suggest an operations test
that is common to all amateurs. Any high school graduate can pass
multiple choice pencil-and-paper tests.

A note on J-poles made of copper pipe -

A friend of mine used 1/2" pipe, while I used some 1" that was lying around. The bandwidth of the 1" version was VERY wide. It also works well on the CAP and Marine band frequencies for you multi-service users.

>1. How much power could one push into this when made out of twinlead?
>Would 5 watts be OK? How about 10?

I suppose you could put power into it until it got hot, probably where the coax attaches to the matching section. 5-10 watts is fine.

>2. How do you tune it? Trim the top?

I posted tuning instructions - they went somewhere. Trim the top to shift the curve upward in frequency, probe the matching section to shift the curve up/down on the resonant frequency.

>3. Can you build this upside down? I.E. Feed it from the top, weight the
>bottom, and hang it out the window by the coax?

Sure. Just be sure it doesn't hang next to large metal objects.

If the transmission is heard, it is intentional interference. If the transmission is not heard, it is not an ID.

Ever hear a "roundtable ID" ? This is where one guy realizes the 7 minutes is up and IDs. Everyone then IDs simultaneously. Try picking a callsign out of that !

I've had batteries go out on the HT before. Embarrassing. Luckily, our local OO is a real human, and would probably overlook it unless it starts happening very often to particular stations. I suppose if the FCC or the local OO finds out and issues a "Notice of <whatever>", you could say that you are rectifying the problem by getting a spare battery.

Source record: 7397

I live in a small subdivision (10 parcels) of 2.3 acre lots. The subdivider was legally compelled by the county government to establish CC&R's for the subdivision. They were *limited*, however.

The county required the CC&R's *only* for road maintenance and for fire hydrant water storage. All other CC&R's were voluntary and we have many.

Many of them have been ignored. We have 'em for weed height (8" max.), one that specifies "white, 3 rail fencing", and lots of other real picky stuff that the original subdivider thought would be "nice".

The subdivider is long gone and nearly all of the CC&R's have been ignored by one neighbor or another (only a 4 year old subdivision).

We have intentionally ignored the CC&R's with exception of the legally required by county items. I too have been told of "abandonment" of the CC&R's.

I am told that the average lawsuit in Calif. for a CC&R violation averages $55,000. We have no (read "zippo") dollars in our litigation fund. What sane neighbor would want to pay $5.5K to sue another neighbor in our subdivision. You guessed it, none so far. I doubt if greater than two or three would ever attempt such a suit and I am certain that it would be impossible to obtain agreement of any majority to engage in such a lawsuit. Heck, we can't even obtain agreement on how to replace a common irrigation tank!

So, in relatively broke subdivisions, it's unlikely that such a lawsuit would occur, in my opinion. I'll include the standard disclaimer that I am not, and will never be a lawyer.

This situation would probably vary in a larger subdivision where fees are collected and the "homeowner's association" is more active.

We are more concerned with spending our money on better things and if we would ever get together, we'd gut the CC&R's.

> 73, Barry WA4VZQ

The rotator being discussed was a U110 being used as an elevation rotator. There's a big difference between a U110 and an HD73 for example. The U110 motor is quite small and can easily be stalled with bare hands. The HD73 motor is quite robust and the gearing is substantially stronger. All Alliance rotors aren't alike. While you can TURN a tribander with a U110, you can't elevate a tribander unless you balance it very carefully. I originally used a HD73 for rotation and a U110 for elevation of my satellite antennas. This worked ok for the little Cushcraft antennas, but the big, long KLM antennas would stall the U110 after about 15 degrees of elevation. By mounting small lead fishing weights on the KLM booms, I was able to balance the antennas so that

the U110 could elevate them. However, when there was even mild icing of the antennas, they wouldn't elevate reliably. When I switched to the KR500 elevation rotor from Kenpro the problems went away. I switched to the KR5400 combined elevation and azimuth system when lightning got the HD73 and I now swing a KLM22C, a KLM40CX, two Down East Microwave loop yagis and a 4 foot dish with ease. The U110 weighs about 2.5 pounds while the KR500 weighs about 15 pounds as does the Alliance HD73. I am convinced that the extra weight is more than just ballast. When I opened up a U110 to repair the clicker, I found the little slotcar motor and mickey mouse gears quite amusing. This is not a robust system.

|>not?

No, they do not. Because there is no proof that *you* copied the code. That's
a requirement for the code tests.

The proficiency certificates require you to send a signed statement that you
copied unassisted, but that statement is more to remind you that you're only
cheating youself if you cheat. There is nothing to gain by holding a cert. for
any given speed, so you only diminish yourself by not doing things on the
up-and-up.

most of the japanese duo-banders of current manufacture can be restored
to the european band plans by either a special power up sequence, or a
diode change or two, like the "dread out of band mods", but it sets it up
for limited band, typically 144-146, and 430-440... The u.s. manuals typically
show the diode configurations for this action.

What I would do is try a few out, see what I liked, and look in the manual;
if the schematic refers to these different models, and shows the diodes for it
or the initialization scheme to set it, then its the one to get.

Most will meet this need
Cheers es 73

I bought this unit because of its coverage of the 118-136MHz aircraft band. It DOES have an AM detector and it DOES receive signals in this part of the spectrum. I am very happy with its performance in the 144-148MHz band. HOWEVER, below 124 MHz my unit is virtually useless. If I open the squelch up and sit at the end of the runway at Austin Mueller, I can hear the ATIS (just barely 119.2).

My question is: does anyone else have anything to report on this model? Is this typical? I am using a 5/8 wave antenna on my car and I know it is part of the problem, but as things stand now this radio is only marginally useful for monitoring these freq.s (I am trying to be objective...am I expecting too much?)

Any comments/suggestions/help would really be appreciated.

Anyone know what the law(s) in Texas are regarding the legality of scanners at the home station and/or in a vehicle? I'm also wondering about 2M rigs with extended receive which are capable of copying police and other public service frequencies in a vehicle. Of specific interest in the Nacogdoches area but the entire State of Texas would be relevant. We're moving to Nacog.

How good is a certification without a witness??

What is to stop me from recording the 35WPM test and then playing it
back at a slower speed (remember reel-to-reel recorders) or just copying
it with my computer. After all, it is sent by computer, shouldn't have
any problem receiving it the same way.

Do you still wonder why not??

2299. Wrong Answers in VEC Question Pool

Newsgroup: rec.ham-radio
Date: 1990-10-24 15:43:23 UTC
From: rlwest@flopn3.csc.ti.com
Message-ID: <9010241543.AA03889@tilde>
Source record: 7409

1. Regarding WHO MAKES THE QUESTIONS--

Right, it's NOT the FCC, but the Question Pool Committee which consists of representatives of the VECs (ARRL, W5YI, DeVry, etc)

NOT each individual VEC making up its own, as I read the comment someone (Jim?) made. The VECs all make up their own tests, but all out of the same Question Pool.

This committee meets regularly, and when they change the question pool, (corrections, additions, clarifications) then they issue statements about which tests are no longer valid. VE teams must use exams from the CURRENT question pool.

I don't disagree with what he said, I am restating it. If I misunderstood it, someone else might, too.

2. Regarding bad keys--

We (1) change the key, and (2) advise the VEC, who publish the tests.

Cheers,
Bob WA8YCD

In regard to wide-band gain blocks (e.g. Mini-circuits MAR-_ series), I would suggest substituting the Motorola MWA-0204 or the Avantek MSA-0_04 series. The disadvantage of the MAR- series is that they are very easily damaged if over driven. The damage level is so low that you can burn one out by driving it with the output of another copy of the same model! On the other hand, I have *never* burned out a Motorola or Avantek unit, despite numerous accidents.

I'm not sure if your reference is to me or not, but if it is...read again. I didn't say the VE's were constrained blindly to use the answer key irrespective of its correctness. I said they were not required to go over the exam with the candidate and inform him which questions he missed and what the correct answer was. They are required to notify him of pass or fail and the number he missed. This has been interpreted by many VEC's (who establish the rules on how the exams will be given) as restricting the examiners to giving only that information.

2302. No code license & CW Bashing

Newsgroup: rec.ham-radio
Date: 1990-10-24 17:01:27 UTC
From: plb@dcdwest.uucp
Message-ID: <1990Oct24.170127.2103@dcdwest.uucp>
Source record: 7412

After reading all the postings, pro and con, as regards the no code
license I've just gotta add my $.02 worth (as wud any self respecting
ham (-;).

I have very mixed feelings re the communicators license. From the
traditional viewpoint "if had I to - so shud you" attitude I'm against
the no code license. IMHO the no code advocates are sterotypical of the 'me'
generation i.e. want it all but aren't willing to work for it.
On the other hand, there is strength in numbers
and if a no code license means an increase in the number of hams then
I guess thats good and I'll temper my final opinion with that in mind.

BUT regardless of how the license requirements come out lets knock off the CW
bashing! I've talked with hams who have had tickets for 50 years and haven't
stroked a CW key for 49 of those 50 years. On the other hand I've also worked
hams who very rarely work FM or SSB and wud much rather spend their time
on the air doin 35 WPM+. Never forget that amatuer radio is a HOBBY.
A hobby which encompasses many modes of communication only one of which is CW.
To those who advocate a no code ticket I say fine, you're entitled to your
opinion, but knock of the CW bashing as justification to support your
arguments. To many of us CW is like classical music or fine wine, it takes
a while to acquire the taste but once you do, then and only then do you
really appreciate the art form.

>AGENGCC@OSUCC Gordon Couger N5QAQ

You can copy GOES satellite photos from HF. They are retransmitted on a
regular schedule. To receive it otherwise would entail considerable
investment for a suitable receiver - although, you can copy it by
connecting a TVRO receiver to an HF receiver.

I use an AEA AVT connected to an Amiga. I get the data direct from the
low-orbit APT satellites using a Realistic scanner on 137.xxx MHz. The
results are excellent.

> just don't understand this. at all..... Is it really against part 97?

Since a receiver is a piece of equipment, is being received without
the receiver owner's permission also illegal? ;-) Or does tuning a receiver to
a specific frequency constitute permission for anyone transmitting on that
freq to be received? ;-) If so, isn't connecting that receiver to a
transmitter defacto permission to use the transmitter? ;-)

Seems sort of like someone repaving the street in front of their
house and then trying to prevent anyone else from using that street.

This is my signature. It doesn't contain my name at all!

I'm not being obnoxious, just confused, . . did you mean 'suffix', the whole prefix/suffix thing in the US baffles me, in England it was easy, there's /A, /P, /M, /MM, and in earlier years /T for the G6/T television stations. Now there's GM0/call etc. in place of the former G5s for guests also. I remember an RadCom article that joked about /V for operation from a volcano!.

But stateside? A few sign /Mobile, most do not; some W4 stations sign /6 in California others do not. When I first came to the 'States I got annual reciprocal licences (make that licenses) and signed (per instructions) G4NOC/W2; years later in California for some reason others were signing W6/Gcall so I followed suit, not really knowing why. When I came to operate packet I discovered AX-25 doesn't (?) have provision for compound callsigns and using them caused endless confusion. So I broke down and got myself a K call.

So anyway to return to the subject matter, is the operator of K1RH/1J5 claiming to be Mr./Ms. K1RH in "1J5" land, or do we have someone purporting to be the licencee/see of 1J5 operating K1RH's station?
Moreover, if King Hussain operated my station on CW would he be KK6JR/JY1 or KK6JR/W6/JY1 and if I had recently upgraded to Extra priviledges would that be KK6JR/JY1/AE or KK6JR/AE/JY1 or KK6JR/W6/JY1/AE or what?
I doubt packet radio could cope with say KK6JR/2/W6/G4CAX/AE-15/MOBILE.
I suppose this isn't near to the longest possible callsign as I seem to recall W6ALPHABETSOUP is within the international regs(?).

Some comments on the Heath version of the Pk-232.

1. For FAX, you can hook up a parallel printer directly to the unit.
No computer required. Or you can dump the data out the serial port.

2. These units give command line interfaces a bad name. A couple
of hundred wierd little commands that are hard to remember, don't
interelate well, and are counterintuitive.
example 1. To change the shift width of the demodulator when
listening to rtty or TOR you use the WI command. To change
the shift width when monitoring AX.25 packet radio, you use
the VHF command.
example 2. In order to listen to TOR, you need to enter your
call letters (or some junk) into the storage for the Selective
Call using the MYS command. Or it won't even listen.
They are really designed to run a transmitter, but their interfaces
make the set/show mode commands in VI look trivial.

Well, it sells driver software.

3. The morse code decoding in the AEA units doesn't track well. A
poster on the rec.ham.radio (Rich Bono?) said he was impressed with
how well his KAM copied morse.

>is about. If I do use it, there are not part 97 violations I have found.

Operating uninvited on a closed repeater violates the "good amateur practice"
clause of Part 97. You might not agree with the decision to close the
repeater, but that clearly does not give you the right to use it. In
the end, the trustee does reserve the right to choose who does and who does
not operate his or her equipment.

>Maybe the FCC rules that make closed repeaters do not GIVE me any right
>to use them, but the license gives me the right to use the frequency, and
>because many people have such licenses, it is reasonable to expect people
>to be using those frequency. The FCC rules DO NOT TAKE AWAY any such
>rights (that may be derived elsewhere).

Having a closed repeater on a frequency does not deny you the right to
transmit on the input. It does, however, clearly deny your use of the
mechanism which keys the trustee's equipment.

>USING a repeater does not cause interference to that repeater.

Ah, how I long to return to nineland, where repeaters are uncrowded, yahoos
are limited, and sideband is actually used! Sadly, in major metro areas,
congestion inevitably leads to interference of some form, sometimes
unintentional, but very often, deliberate jamming. Would you deny someone
the ability to control his or her repeater, so that illegal operation does
not occur through it?

>If the OUTPUT frequency is already in use, the repeater should NOT
>transmit on that frequency. It may be in use from any of a variety
>of reasons. The band plans and coordinations, however, point out
>specific accepted frequencies for many types of operations. Some,
>however, are not mentioned in the bandplans, and any frequency is
>fair game.

Depends on who's bandplan you're talking about. Many states deviate
substantially from the ARRL bandplan; sometimes to pack more repeaters in,
and sometimes to make them feasible (take the ICOM RPT1210 1.2GHz repeater
with its 20 MHz split).

>The PROBLEM is that there are many (and this may be MOST of them) closed
>repeaters are just there to serve a clique. They get very little use.

That seemed to be the case out in nineland, but not here. It really depends on the size of the group that runs the closed repeater. Given the ham population density, we tend to see far more people on our closed machines out here.

>I don't want to eliminate the idea of a closed repeater. There is a place
>for closed repeaters. But I think there are too many of them around right
>now in the 70cm band.

Probably due to all of those surplus Mastr IIs and Micors. 2m in Chicago is heavily PL'd, as I recall.

>All "clique repeaters" should move to 23cm.

Odd. Stanford runs an open repeater on that band (1291.5 -20M, 88.5Hz, W6YX/R) so I'm not too sure I agree with you. I did argue the case for keeping it open (not that there was much opposition), given the nature of the club, and of the band. We went "up there" in part to publicize the band, and I don't think that would have worked in the case of a closed repeater.

Personally, I'd like to see open repeaters as the default, but over the years, I've come to sympathize with others who get tired of having their conversation disrupted by some bozo with a nebulous comment. Also, smaller repeater communities mean that I can keep my radio on at my desk; chances are that when someone comes on, I'd actually want to talk to them.

In the end, both open and closed repeater systems have their merits, and the decision to close a repeater depends on the nature of the repeater community; only the trustee is in a position to make that judgement.

Sometimes I think I'll scream if I see this type of comment one more
time. There's a big difference in laziness versus a desire not to
have to perform makework. And in this case, that's what Morse Code
is, makework. What is so special about CW compared to phone, packet,
RTTY, FAX, and whatnot that makes it the ONLY mode one must prove
ability in to get a license? Sure, as pointed out, it is often the
best method for some transmissions, but all modes have their strengths
and weaknesses. Tradition? Hardly a valid cause for a legal
requirment. International treaty? An unfortunate requirment FOR
BANDS BELOW 10M. So why need CW for a 30Mhz + liscense? Hmmm?

As for CW bashing, I really haven't seen any. I have seen a lot of
people, like me, asking the above, what makes CW so special? And I,
like many others I suspect, am still waiting for an answer. Ham radio
is a hobby, and not everyone is interested in all modes. Why jam one
specific one down people's throats?

Dave (N2AAM) asks:

> information on this (airfone) system, frequencies, modulation schemes, etc.

=======

Again.....the Monitor America book jumps in to solve this conundrum.
Here is the text from page 562 of the 1985-86 Mon. America....enjoy....

AIRFONE, INC.

On October 15, 1984, Airfone, Inc. began to offer air-to-ground telephone service for commercial airline passengers. Using special cordless telephones which accept standard credit cards, the system offers three-minute calls for a minimum charge of $7.50. A network of ground stations carries the transmissions; computer control 'hands off' calls from one ground station to another as airliners move in and out of range. 32 channels are assigned to each transmission site, following the same pattern in each except for the lowest frequency assigned. All stations transmit on AM signle sideband (A3A).

Transmitter Site Frequencies Begin

Abajo Peak, UT 945.204
Albuquerque, NM 945.804
Atlanta, GA 945.404
Austin, TX 944.204
Boston, MA 945.204
Bridgeton, MO 944.604
Burlingame, CA 945.204
Charleston, SC 944.604
Charleston, WV 944.204
Chicago, IL 945.804
Delta, UT 944.204
Denver, CO 944.604
Des Moines, IA 944.204
Fort Wayne, IN 945.204
Grand Island, NE 944.404
Hawthorne, NV 945.604
Houston, TX 945.404
Irving, TX 944.804
Jamaica, NY 945.204
Klamath Falls, OR 945.884
Las Vegas, NV 945.404
Los Angeles, CA 944.604
Meridian, MS 945.604

Miami, FL 944.404
Monahans, TX 945.004
Nashville, TN 944.404
New Orleans, LA 945.004
Orlando, FL 945.004
Phoenix, AZ 944.804
Pittsburg, PA 944.804
Seattle, WA 944.604
Shreveport, LA 945.804
Springfield, MO 945.404
Tallahassee, FL 944.804
United States (National Channel)899.000
Washington, DC 944.604
Wilmington, NC 945.204
Woodward, OK 945.604

Channel Plan

Channels are separated by 6 KHz except for the last channel assigned to each location, which is 10 KHz higher than the preceding channel. For example, if the first channel in a group is 944.204, the sequence would be:

944.204 944.210 944.216 944.222 944.228 944.234 944.240
944.246 944.252 ..... (it continues on....and on)
944.378 944.384 944.394 (end)

> not an RF ground?
> I know how to construct an electrical ground, but how do you construct
> an RF ground?

Welcome to the crowd. Many old timers are also confused about grounds. The basic idea is that if something is grounded, it has no voltage on it. But wait! A voltmeter always has two leads, and where do you connect the black lead? Through how long a piece of wire?

At DC or 60 Hz, a wavelength is so long, that the dimensions of a ham shack are usually negligible. If your soil is a moist, a short piece of pipe usually works. The typical building code requires an 8-foot copper-plated rod which can purchased at most building suppliers. In older houses with metal water pipes, a connection to the cold water plumbing will also work. You may find a green wire from the back of your washing machine to the water pipes. NEVER NEVER USE THE GAS PIPE!!!

If you get into the details of house wiring, you will find that there are three wires going to every receptical (outlet). One is neutral, and one is the safety ground. These are connected at some point either where the power comes into your house or in the utility company wiring. (The details may be different outside the US.) When a substantial current is being drawn by the lights and other things in your house, a few ohms resistance in the wires times 10's of amperes can cause the neutral to be many volts from the safety ground. The safety wire keeps the metal case of your electic drill or radio from having any of this voltage.

With radio frequencies, ground gets more interesting. As mentioned by a previous poster if the distance approaches 1/4 wavelength, a wire with no resistance might not make a good ground. The question becomes, "what are you tying to achieve by the ground, anyway?" A person working on a circuit inside the radio typically "defines" the chassis as "ground". All voltage measurements are taken with respect to the chassis. Bypass capacitors either connect to the chassis directly, or to a PC board trace which goes to the chassis. If the radio is a handheld or a satellite, this is all that can be done. There is no conductor going to the earth.

The most complex situation is something like a 10 meter station not running QRP and not having a short route to the earth. If the antenna is a just a piece of wire connected to the back of the radio, you might have some unwelcome effects. RF from the antenna can easily flow onto the chassis of the radio, and into the house wiring. The microphone can become a part of the antenna, and give you lips a shock, or get into the audio circuits of the radio. Current following the house wiring can get into TV sets. Radiation from all of these may make your antenna pattern something other than what you might expect from just examining the wire you put up as an antenna. Solutions are numerous, and you might need to do several of the following to solve your difficulties. Then again, you just might be lucky and not need to do anything special.

First, I recommend using some kind of balanced antenna instead of an end-fed wire. Such as a center-fed dipole or a loop. A vertical antenna with radials has its own ground system. If the currents in one part of the antenna can "see" the rest of the antenna, they will not look so hard for some other places to go, like your stereo wiring!

An antenna tuner designed for balanced wires, ferrite beads on the outside of the coax, or a balun will all keep the antenna currents away from the rig. I have heard it said that loop-type antennas act as a built-in balun. I used a quad for many years without feeling any need for a balun.

(As an aside, I do not have a lot of warm feelings for the many popular tuners which have ferrite balun built-in. Almost invariably the balun is on the antenna side of the impedance matching circuit. All baluns work best over a limited range of impedances and frequencies. If a balan is designed for 50 ohms and put where the impedance is something else, the balun may not do a good job over a broad band. My personal preference is either use an antenna with a 50 ohm impedance with a 1:1 balun, or use a tuner designed to handle open wire line. Look in an old edition of the ARRL handbook.)

Someone else mentioned the possibility of a counterpoise (and the MFJ artificial ground). These are really an extension of your antenna system that sets up currents to cancel the RF voltage on the radio. Under some conditions, a LOT of current may flow in the counterpoise, and the far end will be have a very high RF voltage. So watch where you run the wire and how you insulate it. By their nature, couterpoises are narrow banded.

Another consideration of RF grounds is TVI. The initial assumption is that the cabinet of the transmitter is completely sealed. Every transmitter generates some amount of harmonic energy. If there is a small crack in the case, or a key lead is not bypassed, the RF could get outside the radio and travel to a nearby TV set. This is less likely if the outside of the radio is grounded at 50 or 100 MHz! Now we are talking really short connections! If you have a case of TVI with the transmitter connected to a dummy load, you need to either improve the ground, or the bypassing and shielding of the transmitter cabinet. I once had such a situation. Fortunately, my shack is on an outside wall

at ground level so a short ground wire was practical. Experiments with shielding and bypassing made it possible to operate with the ground disconnected.

Good luck with your studies, and don't let the other people discourage you from enjoying Morse code.

Source record: 7425

I am posting this message here for a couple who are hams in Paupua New Guinea. They work as language translators in the bush, and want to use HTs to keep in touch while John is away from the village.

John writes the following:

"As you know, Marsha's dad and mom are leaving for PNG on Nov 29.
If its possible, we'd like to get some 2 meter handi-talkies so they could hand carry them here. We're looking for a pair of Icom IC2ATs that use AA batteries/nicads. Something that puts out 5 watts if at all possible since that would help cover greater distances(very few repeaters here).

If AA power is not available any more, we will need a way to charge the battery pack from 115/240 ac (our generator is 50 cycle) or from 13.5v dc (our solar panels - this may require an in-line resistor set up of some sort)."

I thought it might be interesting to post part of his message here. It was written 10/14 and received in Dallas 10/23. Thats not too bad for snail-mail world wide. Lets see how quickly this gets around.

It would be nice to hear from anyone having an idea what the going price is for what they are looking for.

They can spend from $200-$250 dollars for the pair.

This may be be far out, but If a tax deduction is interesting, I think the organiation they work with, qualifies.

Anyone having one or more of these, please e-mail me direct.

Subject: Re: CAUTION! Failed an exam?

From Jim Johnson WA6SII:

> disappointed to hear the "hard-nosed" approach by the guy who does
> not normally let the examinee see his/her paper to see which questions
> were missed. I was refreshed to hear from the person who likes to
> go over the exam with the examinee so s/he can learn from their
> mistakes.

This thread is interesting, inasmuch as someday I may be a VE. Long ago in the dim past, a person failing an exam (given only at FCC offices) had to wait a month before re-taking the exam. Now, as I understand it, one can fail an exam, then turn right around and re-take it minutes later. Is this correct? Suppose I have gone over the questions the examinee missed, and the same questions just happen to pop up on the next exam I give moments later?

How can I, as a conscientious VE, adhere to the intent of the rules in a case like this (and it is *bound* to happen). It seems to me that I should either not review the missed questions, or I should not allow the examinee to re-take the exam until (24 hours? 3 days?) later. How say ye, sincere netters (and flamer-throwers, too)?

The N5PDK dude dube@cpdvax.csc.ti.com sez:

>>Say what?? How come Derek can use the 20 wpm CSCE for 5 or 13, but can't use
>>a 25 wpm CSCE (or higher) for 20?
>>Does honor run out somewhere between the 20 CSCE and the 25 CSCE? Or is it
>>interpreted differently for a G# than it is for an AA#?

Sigh. You're trying to bait me, right? CSCE stands for Certificate of Successful Completion of Examination and is the bit of paper you get after a VE exam. A 20 wpm CSCE is what you get when you pass an FCC/VE 20 wpm test. As against a "code proficiency certificate" or whatever it is that the ARRL gives you for saying you copied their code transmissions.

>>Weaving between Derek's flames, I can see his real point, though.

OK, that's good. Many others made the same point. And anyway, I wasn't flaming, I was just setting the record straight :-)

>>73, Dube N5PDK

You too, Dube!

Speaking of certificates, anyone want to discuss why the WAZ and several other certificates refer to the awardee as male only? All my WAZs (how immodest) say "HE is authorized to include the letters WAZ ..... originating from HIS station". Any female ops out there with a WAZ? Do they cross out the "his" and put "her"? Does anyone find it insulting? (and if not, would you think it strange for a male op to have a certificate attesting to "her" performance?). All the ARRL awards are clean - WAS, WAC, DXCC - although, blowing the dust off my ancient WAC from my G3 days, that did contain the mail-only language at that time. My WAC-YL certificate is understandably Politically Correct. All three of the Hong Kong club certificates (illustrated in the ARRL Operating Manual) are beautiful pieces of wallpaper but are all sexist in their language. Should I send mine back in protest? Seriously, though, isn't this archaic?

+>
+>>>>>>> 31 open 450 MHz
+>>>>>>> 488 closed 450 MHz
+
+If Communicators are limited to 220 MHz and above, most are going to end
+up on 440 MHz because of the equipment availability. This is going to
+wreak havoc with the 440 MHz private repeaters. The closed club repeaters
+would be a significant problem as long as the clubs don't practice any
+discrimination on the basis of license class.

I hate to be the messenger of bad news, Phil, but this is already being done quite regularly! Most clubs advertise 'open membership' but in fact have a 2-tier system of membership that allows for exactly this type of discrimination. Here's an example of how it works:

I joined a 220 MHZ Repeater Club..let's just call it "The Club". They had an open meeting, invited the whole Amateur service to attend, get aquainted and maybe join up. I went..it was held at a restaurant. The membership chairman tendered my $25 and gave me an "Associate Membership" card, saying that it was good for 1 full year, and that after that year I could petition for full-membership..PROVIDED THAT ONE OR MORE REGULAR MEMBERS WOULD SPONSOR ME. I didn't actually realize what that meant at the time.

The public portion of the meeting lasted from 5:30 to 7pm, then the regulars and the newly-minted Associates moved from the public dining area to a back-of-the-restaurant banquet room. The President and VP joined in thanking us for taking associate membership; then they explained how the club operated.

There were 22 regular members. 5 of which comprised the TECHNICAL STAFF, these were the guys that actually kept the repeater running. The remaining 17 were the MANAGEMENT STAFF, all club offices, Pres, VP, EVP of Membership, EVP of Publications (they have a monthly newsletter..like most ARC's), EVP of Events, EVP of PR, etcetra...on and on they introduced these people to us. Most of the "officers" were members of one of the 4 families that seemed to be involved with the club...!!

Regular members were the ONLY ones allowed to access the phonepatch, the talking s-meter functions, the cross-band link to 2m, etc. RIGHT! The associates were allowed to use the machine, and attend the open-meetings but not the business-meetings, or the vote-meetings. UHUH!

Most of us left the meeting wondering what we'd just spent $25 on! It would become clearer in the days ahead..it started with the rejection of

an article that my friend and I wrote for the club newsletter. "Too technical!" the EVP of Publications told us, "No one cares about that mumbo-jumbo!" He had asked for contributions at the next meeting, saying that there's always room for some more "well written articles"...the next newsletter featured badly done xerox's of photos taken at the last dinner function. The people in the pics were (surprised?) the regulars and their kids. He also included a poem about Amateur radio that his daughter had written for her 7 grade English class.

Then the repeater turned to shit as the jammers began harassing everyone, my friend and I t-hunted one of the offenders to his QTH. When we presented the information to the Club Pres., he took the paper we offered, crunched it up and tossed it into a trashcan saying: "We're not going to do anything about this, if ignored it will stop..."! We later found out that the jammer was a former "associate member", he was also a cousin of the Pres!

My friend stood up at the next meeting and announced that he would not be a part of such an organization, and left! The whole club looked at me... the Pres. asked me how I felt. I told him that some things seemed quite irregular, and arbitrary. He assured me that "this a family-oriented" group and asked why I didn't bring my WF to the next meeting...hmmmm.

My WF (KB6VUZ) attended just exactly ONE dinner meeting, on the way home she told me that this was the most absurd collection of ego-maniacs she had ever seen and refused to ever associate with them again or to use the repeater! Apparently the other women in the club didn't approve of her wearing leather motorcycle pants in public, in front of their children!

The next issue of the Club newsletter had an editorial in it that I took issue with. The writer (we never did find out who actually wrote it) was telling the readers that: "..if you hear a QSO in progress that YOU DON'T LIKE, if the people are discussing topics that you wouldn't want your children to hear about, or if you think that the language being used is not proper or if they are telling jokes that are in poor taste, key up ID and remind them that this repeater is dedicated to FAMILY RADIO!.." on and on with a final option to call so-and-so and have the machine taken off the air. Well, ok..I mean if a QSO were advocating something illegal, or suchlike..what I didn't know at the time of reading was how literally some of the regular members were going to take this advice!

In the days that followed I was reminded about FAMILY RADIO, by a good 1/3 of the regular members..."We don't want to listen about OSCAR!" - "You guys with those computers are such a drag!" - "You're not supposed to talk about that! <cars, motorcycles, parties, girls/guys, surfing, the 60's, the War on Drugs, etc> I asked one of the regs what she thought was a proper topic for FAMILY RADIO...she wasn't sure...I asked her how all these families came to be...she shrieked and went QRT adding that I was some kind of a nut.

Finally, I went to a last meeting...my WF was right, my friend was right. This was the most pedantic and perverse collection of non-technical

wierdos I'd ever meet! I asked the President if PART 97 applied to FAMILY RADIO, he just shrugged and said: "Do you expect us to sponsor you or not?". I stood up and said: "Don't bother, OM, I just hope you're ready to lose your ARRL affilation!". He laughed. I left. Six months later the Club folded, and then started over..I'm in the process of challenging their bid for another 220 pair on the basis of what happened.

ARC's?? Great idea...discrimination? YOU BET! And there's damn little to be done about it! The 220 organization I belong to now is a very liberal and reasonable confederation of folks, no regulars vs. associates, no votes - one guy is our repeater trustee - it's $100/yr and no one snivels about the topics so long as Part 97 is being adhered to..and we all can use the autopatch.

FAMILY RADIO - what a joke!

+"Latch to flap" is the term used around here for the type of operation
+by people who seemingly have locking switches on their keying line -
+once they begin transmitting, they announce their whole medical history
+before unkeying, except for brief periods to 'reset the repeater'. That's
+directly opposed to push-to-talk one-thought-per-transmission modes of
+operation that are still common on private systems.
+
I kid people about this, reminding them that if they keep it up I'll
give them a PUSH-TO-LISTEN-SWITCH type microphone so their thumb won't
get so tired! ;-)

+ As more of the old farts came up from 80 meters,
+the type of operation they were used to there came with them.

This is the explaination that seems to fit, some of those guys on 75/80 AM..
..jeezz they're long winded! My 1970 ARRL handbook reminds people that the
"old monopoly-switch routine, where the operator gabs to himself for five
minutes at a time will get him invited off a busy VHF-FM repeater!" yup!

I built the twin-lead J-Pole.

$11 built two of them, with twinlead left over. (The coax feeders were higher cost than the twinlead. :-) It took about 15 minutes to knock out the first one, and ten minute to do the second.

I live in a no-antenna apartment. The manager states that we obviously have no hams in the building, since she is able to watch TV. I decline to discuss the subject with her further at this time :-)

I threw the twinlead J-pole out the window and keyed up. The reflected power barely moves the needle.

Thanks for the posting on how to build it. It's solved my antenna problem.

QST DE W1AW
PROPAGATION FORECAST BULLETIN 43 ARLP043
FROM ED TILTON, W1HDQ WETHERSFIELD CT
OCTOBER 22, 1990
RELAYED BY KB8NW/OBS & BARF-80 BBS
TO ALL RADIO AMATEURS

THE SOLAR FLUX TREND WAS MOSTLY UPWARD THROUGH THE FIRST HALF OF
OCTOBER. ON THE 15TH THE FLUX REACHED 232, ITS HIGHEST SINCE LATE
IN AUGUST. DURING THE PAST WEEK THE FLUX HAS CONTINUED ITS ERRATIC
COURSE. ON THE 18TH IT WAS DOWN TO 195. THE NEXT DAY SAW IT BACK
TO 221. ON THE 20TH IT DROPPED 24 UNITS TO 187.

ON THE AFTERNOON OF THE 20TH WEATHER CONDITIONS WERE FAIRLY GOOD FOR
SUN VIEWING, BUT THE SOLAR DISC WAS NOT AN ENCOURAGING SIGHT.
SEVERAL SMALL GROUPS WERE VISIBLE, BUT THE OVERALL IMPRESSION WAS
THAT THE FLUX MAY GO DOWN BEFORE IT TURNS UPWARD AGAIN.

FLUX LEVELS HAVE NOT BEEN TOO BAD. THEY WERE CONSIDERABLY BETTER
THAN IN SEPTEMBER WHEN THE HIGH WAS ONLY 206, AND THE AVERAGE WAS
CONSIDERABLY LOWER THAN OCTOBER'S IS LIKELY TO BE.

WHATEVER HAPPENS ON THE SUN IN NOVEMBER, TRADITIONALLY A GOOD MONTH
ON THE HIGHER FREQUENCIES, IT IS LIKELY TO BE THE BEST WE WILL SEE
ON 28 AND 50 MHZ FOR QUITE SOME TIME.

AMERICAN SUNSPOT NUMBERS FOR OCTOBER 11 THROUGH 17 WERE 156, 170,
176, 190, 204, 169 AND 160 RESPECTIVELY, WITH A MEAN FIGURE OF 175.
SOLAR FLUX NUMBERS AS REPORTED BY WWV FOR THE SAME TIME PERIOD WERE
202, 200, 207, 220, 232, 226 AND 193, WITH A MEAN FIGURE OF 211.4.

2324. electrical vs RF grounds

> in both RF and DC.

Apparently the important factor is that all "grounds" that are
pertinent to your shack's operation be at zero potential with respect
to each other. There was an interesting article in Beam magazine
about lightning protection that mentioned "step" voltage difference.
This is the difference in potential between tower ground and house
utility ground if they are in different locations.

I guess it was the arrogance that comes from being in a country
that has FULL use of 3 different prefix letters (K,N,W) for callsigns
and forgetting that we, as well as other countries, may have to share
prefix letters (like A).

Bob Carpenter's computation of how much microwave spectrum would be needed to support various amateur modes reminds me of the old joke about the civil engineer who was given the job of designing a bridge across a river. His first order of business was to determine how many lanes of traffic the bridge should have. Not having any better source of information, he sat down on the river bank one afternoon, counted the number of people who swam across the river per hour, tripled that figure (like all good engineers he believed in conservative design rules) and sized the bridge appropriately.

Seriously, simple extrapolations can often get you into trouble. If the history of communications has shown anything, it is that people are very clever at coming up with new uses for communications facilities that were never thought of by the original network designers. We now have a telephone network that was originally designed specifically for voice. Nobody ever thought that we'd now be using it for fax, computer data, slow scan video, pocket pagers and so forth.

What we really need on the amateur microwave bands is an enabling technology. I believe that high speed digital modems like those N6GN et al are developing are that enabling technology. Any form of information can be represented in digital form, and the economics of the technology areq such that going digital is the only practical way that we could handle large amounts of information (particularly information multiplexed from many sources) in a microwave-based amateur radio network.

2329. Packet around 6MHz??

Newsgroup: rec.ham-radio
Date: 1990-10-25 12:24:54 UTC
From: PJML@ibma.nerc-wallingford.ac.uk
Message-ID: <25.Oct.90.13
Source record: 7239

Someone asked about packet on around 6MHz; well in Europe there are a number of pirate users who hang around 6.6 to 6.7MHz using modified ham gear to work SSB, theres also some number of them doing this on packet. They make up their callsigns; They call themselves 'International breakers' and i have heard numerous stations claiming to be in Britain, Ireland, France, Italy, and several of the Nordic countries.
These nets have been going for many years (they started off after WW2 using ex-government radios which could be bought dirt-cheap, or fished out of the remains of tanks, aircraft etc. that littered most of Western Europe at the time).

p.s. i hear that a number of Polish hams have acquired radios etc. left behind by the retreating(?) Soviet army and that some of these radios cover the 50MHz band....

>25 WPM, do I get credit for the 20WPM CW portion of the exams? If not, why not?

What is a "qualifying run"? If you mean the ARRL code practice
qualifying runs the answer is no. Obviously, having perfect
print out of the ARRL qualifying run is no proof of code ability-
it just shows your computer works ok.

However, there is one way of getting credit for the EXTRA code test.
I got my extra class license without ever taking an amateur extra
class code test. If you are a holder of a commercial 1st or 2nd
class radiotelegraph license, then you get credit for the amateur
extra. The code portion of the 2nd class radiotelegraph test
consists of two separate tests (at least, it used to):

1. Copy plain text, including punctuation , . / ; "
( ) @ - = at 25 wpm for one minute without error.

2. Copy 5 letter/number/puncutation code groups at
25 wpm for one minute without error.

This test if only administered by the FCC at an FCC field office
by appointment only.

Believe me, its much easier passing the amateur extra at a hamfest!

^^^^^^ ^^^^^
To throw in my 2 cents' worth, don't forget that copper braid or strap tends
to make a better rf ground than a simple wire in most, if not all, cases.
Case in point: in our research lab at Purdue, we have a 6 kw, 6 kv DC
power supply connected to a electron-gun evaporation system. These systems
are notorious for arcing during operation, thus presenting mucho transients
(read: transient, hi-power rf) to the vacuum system chassis, power supply
chassis, mains, etc. The installation manual specified grounding the vac
chassis to the supply, and the supply chassis to the ground rod, with
6" x .050" copper strap. Our run was about 50 feet, near their predicted
maximum allowable. That, as Paul Hogan would say, is a GROUND! :-)

Receiving unauthorized programming through a modified Videocipher module is potentially unlawful, thus there is reluctance to discuss any methods in a public forum such as this.

What can be said is that the Videociopher 2000 and 2100 models 018, 019 and 032 have been widely compromised by so-called "chippers". Who alter the units' firmware to simulate authorization of multiple services. The compromise is made possible by an extremely poor and short-sighted design of the DES key manangement by MA/Com, the original designers of the system.

There have been significant changes incorporated in the newer Videocipher Plus which are claimed to prevent chippers from attacking with current stategies. Digicipher, reported to be compatible with HDTV, is in the works.

Yes, there is a 900 number which reads numbers to you in hexadecimal format. There is no explanation of what the numbers are for or what to do with the numbers. I don't think it would be a very smart idea to call that number from your own home unless you want the FBI knocking on your door next month.

There are many sources of so-called Videocipher "repair" software. The best way to find out is to get a copy of a magazine called "Satellite Watch Newsletter" and read the ads (it is virtually 100% ads). It's easy to get taken. I doubt that anybody is going to be stupid enough to go the the postal inspector complaining that he/she was ripped-off buying illegal Videocipher firmare, but only recieved a box of a few scraps of wire and some old TTL chips. Caviat emptor.

>Does honor run out somewhere between the 20 CSCE and the 25 CSCE? Or is it
>interpreted differently for a G# than it is for an AA#?
>

There is a little confusion here.

Your original question asked why you couldn't use a *qualifying run
certificate* to prove competency with the code. Derek pointed out that
the *qualifying run certificate* is given by the ARRL for copying code
at home, and then he referred to a CSCE which is a Certificate of
Sucessful Competion of **Examination.** A CSCE is given out by VEs at
VE exams for passing a VE exam. Derek took the 1c test and passed at
20 wmp; therefore he didn't need to prove proficiency at 5 wmp or 13
wmp.

So, there is no issue of "honor running out" between 20 wmp and 25
wmp since the two are entirely different.

85 is 85 mil plastic

the 04 is only shown to be available as the
MSA-0104,MSA-0204,MSA-0304,MSA-0404 in my (1987!) Avantek catalog.
The MSA-06xx is a particularly useful device because of its
stability and lower noise figure. The MSA-08xx can be lower noise
and higher gain but is only conditionally stable. In fact, my fairly
careful measurements in a well characterized fixture with accurate
deembedding show it to be somewhat *less* stable than the published
specifications indicate. It is useful too but extra care has to be
taken. As far as I know the MAR-6 *is* an MSA-0685.

BTW, the white dot (chamfered end) is the *input* lead on this part.

I have never yet blown a MSA/MAR series part out by overdrive. I
have broken a whole lot of leads off at the package though!

>and put "her"? Does anyone find it insulting? (and if not, would you think
>it strange for a male op to have a certificate attesting to "her" perform-
>ance?). ...

To be pedantic, Derek, they are correct and inclusive.

English has given up most use of gender in nouns, unlike many other languages which categorize essentially all _words_ (not _things_) by gender. Note that gender is a characteristic of a WORD, not a THING, so two synonyms can have different gender. (Also note that people do NOT have gender; they have sex. Using "gender" to refer to people is a poor euphemism. E.g., we can not have a gender-neutral personnel policy, but we can have a sex-neutral one.)

The few remnants of gender in English are for personal pronouns, where gender refers to sex. Due to the way the language evolved, we ended up with "masculine" pronouns and "feminine" pronouns. The latter apply only to female persons. The former apply to both the "masculine gender" (male persons reference) and the "common gender" (no sex implied).

Thus it is correct to say that if your secretary is good, he won't misplace your mail. It is wrong to say "she won't", unless you're referring to a particular female secretary, since secretaries _can_ be male, so common gender applies. Ditto for telephone operators & nurses (not wet-nurses, though). And on the flip side, it's right to say "He" on a DX award that can go to a person of either sex.

The college I attended was all-female before 1971, except for 1946-51, when it took male war veterans. But it had an _alumni_ (male and common) association, not _alumnae_, since it was not _exclusively_ female. Alas, we poor menfolks don't even have a pronoun referring to us exclusively!

Now back to the other flame wars already in progress.

Sounds great! But you sure pay for that extra power - they are very expensive, both under the Kenpro name and the re-packaged Yaesu model. Has anybody gone shopping for these combo rotators lately - it seems like the prices are pretty much the same everywhere, but I haven't looked more than a few places.

I'm wondering, also, if you can have a few hundred feet of control cable before the meters become inaccurate.

There was a nice (long) paper in the most recent ARRL/CRRL networking
conference proceedings(pp 25-72) by Dan Doberstein describing construction
as well as a good deal of GPS fundamentals. For anyone interested in
building a GPS receiver I think this would be very informative. The author
clearly spent a lot of time at it. I'm not sure how it ended up in
that particular proceeding but its a nice paper.

>interpreted differently for a G# than it is for an AA#?

All right, let's go back to the beginning on this one. "CSCE" stands for Certificate for Successful Completion of an Examination. It's what the VE gives you when you pass any license examination element, and it can be used to satisfy any element requirement needed for a license or a license upgrade for a period of up to one year from the date it was issued. What Derek was telling you, and you obviously couldn't copy even as ASCII text, was that he didn't even need to bother himself with the 5 and 13 wpm tests. He passed the 20 wpm test off the bat, and then used the CSCE for that element as he worked his way through the written elements. Believe it or not, you could even do the same with your N5 prefix!!

>>on the air from any old location and give yourself a silly 'prefix' and
^^^^^^^^
>I'm not being obnoxious, just confused, . . did you mean 'suffix', the
>whole prefix/suffix thing in the US baffles me [etc]

Yes, I thought of that e'en as I penned my missive. I think of the prefix of a call being the bit that usually goes in front and tells you which country/reef/rock the signal is from. Thus KH6 is the prefix for Hawaii, whether it occurs as KH6XX or as K7SS/KH6. The suffixes in those cases are XX and SS, even if SS does come in the middle :-)

The WPX (Worked Prefixes) awards and contests use prefix in this sense too, that's what I had in mind. Whether K1RH/1M7 should be signing that way or 1M7/K1RH I really don't know or mind too much. I've heard stations in West Virginia signing with their own call /WVA. In some countries you append your own call to a club call - there's a VU station on the air sometimes signing /LID, because it's being operated by VU2LID (I'm not making this up, although I've often thought it would be nice if you could append things like that to the calls of people you work sometimes, I thought of adding /QRP each time I work a particular contester rumored to run molto KW in contests).

Anyway, on the other points, yes, if you live in Texas and use a reciprocal call you sign W5/call. I guess the idea is that if you sign BY1XX/W5, you get listeners' adrenalin flowing early, and it's an anticlimax when they get to the W5 bit. When you hear the call with W5 in front, you keep on tuning past the second you hear the W - that may not be what the FCC had in mind, but it works for me!

The other night I was listening to Radio NY International (7520Mhz).
They sounded like a pirate station except it turns out they were
being broadcast by some other station that seems to be legal.
They apparently used to be a real pirate station operating off the
east coast on a ship. Does anyone know anything about them. They
were very entertaining and I'd like to know their schedule as well
as their story.

Thanks,

Jon

Yes, but they must pay another fee. ($4.95 or whatever it is at the time.)

> Suppose I have gone over the questions the examinee missed, and the
> same questions just happen to pop up on the next exam I give moments later?

They should not be given exactly the same test. There should not be any of the questions exactly the same on another test. [That's why there are about 10 times the number of questions in the pool as on the test!]

I don't know about other teams and VECs, but our VE team has exam sets consisting of several exams for each element. Every applicant that comes through our group has an index card with the date, which exam element and serial number, and the result (Pass or Fail only). If someone wants to take an exam element (code or written) we check (1) if they have a card in our file, (2) which, if any, of those exams desired they've seen before.

If someone comes in who's been with us before, we check and give them a different exam for the element they want. We actually do check, and keep records. That's the best, I think, that we can do, and I think also in most situations, it works. There's always an exception.

> How can I, as a conscientious VE, adhere to the intent of the rules in a

> netters (and flamer-throwers, too)?

OK here's a scenario. Many VE teams in the Dallas area are W5YI-VEC sponsored. The VEC provides test kits (several exams, appropriate keys, and stuff) to the VE teams.

An individual *-could-* go to VE Team X in the morning, attempt and fail exam 3A-#Z90 (a fictitious number) then go to the next suburb, to where VE Team Y is giving exams that afternoon and get the same exam. VE Team X and Y do not exchange records because the problem is not one that is worth the effort.

FCC Rules part 97.205 paragraph E sentence #2
(e) ..."Limiting the use of a repeater to only certain user stations is
permissible."

Self explanatory.

>But if I find my way into the repeater anyway, then it is effectively
>NOT CLOSED for me. The INTENT on the part of the operator to not allow
>me to use it is what the issue is about.

If the front panel switch was turned off on the repeater, and you drove
up the hill and turned it on, you would have also made the system "NOT
CLOSED" for you... His intent there is that the repeater not be used
also by you, or in this case anyone else. If your definition of a
CLOSED system is one that is physically impenetrable, okay. But usually
it means a repeater that has use limited to certain users. And you have
not become one of these designated users by figuring out the repeater
PL, Touch Tone, digital squelch or whatever system implemented to hinder
unauthorized use.

>If the OUTPUT frequency is already in use, the repeater should NOT
>transmit on that frequency. It may be in use from any of a variety
>of reasons. The band plans and coordinations, however, point out
>specific accepted frequencies for many types of operations. Some,
>however, are not mentioned in the bandplans, and any frequency is
>fair game.

Agreed. And if a repeater is operating out of coordinated band plans,
it must accept the consequences. And people operating in the repeater
sub-bands, say simplex on a coordinated repeater output, also must accept
that a repeater may key up on top of them.

>All "clique repeaters" should move to 23cm.

Or all those who are dissatisfied with what's on 70cm, move to 23cm...

Yes. When I moved to CA from OH, I worked the 20 meter CW county hunters'
net the whole way out, running 100W through a tuner into a 10-foot CB whip.
Keeping a logbook can get a little hairy at 55 mph on the freeway, but
the actual operating was a snap. I had the keyer paddle strapped in just
to the front of the passenger's seat where it was comfortable to reach.
If traffic required my immediate attention, I could "retrieve" my hand
much faster than if it were holding a microphone.

>...If you want the law to protect your equipment from my use, put it
>on a part of the spectrum where the law has such provisions.

Doesn't do any good! The commercial-band UHF repeater where I work (Indiana University) has been plagued by bootleggers with programmable radios, including "cable gypsies" (itenerant installers of CATV and other utility lines). They move into an area, get on common repeater freqs, try different CTCSS ("PL") codes until they get a repeater to work, then disregard its licensed users. FCC won't expend the effort to catch them.

They claim they have a license for our frequency (they do, but not in this area), and they move all over the state using four different licensed frequencies and whosever repeaters are in range. (Who needs ham radio?)

We could have a major "fox hunt" with attendant legal hassles (they have threatened bodily harm to us! Maybe we should take the football team along! %-) The practical solution is digital squelch with thousands of combinations, but management is too cheap to buy it.

2358. Kenwood ALC meter and the avoidance of lidditude

Newsgroup: rec.ham-radio
Date: 1990-10-25 19:36:44 UTC
From: obrien@aero.aero.org
Message-ID: <89675@aerospace.AERO.ORG>
Source record: 7268

Got some on-air advice this morning that I'd like to check out. I own a Kenwood TS-440S. One of its meter switch positions is for ALC (which, in typical fashion, isn't even defined in the 440 manual. You have to read the 940 manual to find out that it stands for Automatic Limit Control.). They say, "don't let even the peaks of your SSB output go past the end of the red zone." The guys on-air said, "The meter needle shouldn't move at all. If it does you're going to splatter."

The best I can figure out is that they're both right. The only thing I can think of is that the meter needle indicates, by moving away from zero, that the transmitter is limiting your peaks to prevent overmodulation, and that if you go past the end of the marked zone, you've exceeded the transmitter's ability to compensate, and will start splattering at that point, but not before.

If anyone knows the straight poop on this, I'd appreciate hearing about it. Going off the air for twenty years and then coming back as a "lid" is just what I need.

Back in the days when you actually had to obtain an FCC license to run a CB radio, CBers had callsigns that were of this form. For example, one was KLQ0863. Since they eliminated CB licensing provisions entirely, presumably they could reassign the namespace.

>
>... it's right to say "He"
>on a DX award that can go to a person of either sex.

Grammatically "right," perhaps, but not inoffensive.

True, we need a good solution to this problem. And as Patrick pointed
out, we don't have an entirely satisfactory one yet.

But in the interim, many documents can be written without using the
third-person singular. I have DXCC, WAC, and WAS certificates on my
wall that prove it's entirely possible--without sounding convoluted.

I'm sure the WAZ folks could come up with acceptable rewording if
they cared. Apparently they don't. (Or at least haven't so far.)

> CW ? Gak. That's even scarier than The Bomb itself.

No, not HF CW. Try LF packet radio. Have you heard of the Ground Wave
Emergency Network (GWEN)? It is specifically designed to work after
the Big One is dropped.

You have to admit that for this application, packet has some nice
advantages over CW. For example, it'll keep working after all the
humans on the planet (yes, this includes all of the CW operators) have
been killed off by radiation. (Remember "On the Beach"?)

I may not think much of the doomsday thinking that led to the
construction of GWEN. But I must admit to being glad to have it around
because I can use it to annoy the heck out of the "CW, vacuum tubes,
blood and guts forever" types who keep insisting that they'll have a
complete monopoly on communications after a nuclear war has toasted
all of the more modern electronics... :-)

As you say, for the discussion in question, it is not specifically relevant, but a fact nonetheless.

Just remember, it IS an issue for some people. Some kid who gets a fixed allowance and no help from parents may disagree. Also, some people gripe about the "THROW MONEY AT IT" theory of solving problems. (but that's another discussion thread!)

> > Suppose I have gone over the questions the examinee missed, and the

> times the number of questions in the pool as on the test!]
>
> ......Do you run off several different tests for each session and check
> them to see that there are no questions are duplicated?

The exams are taken from W5YI-VEC distribution kits. The VEC prints the test sheets and provides keys and answer sheets. We have one of each different exam. We give the applicant the exam and an answer sheet, and put the exam back in the file when we are through. W5YI-VEC makes up the exams. One question might be on two exams. It is unlikely (but not impossible) for someone to get the exact same question twice.

We trust the VEC on two counts:
(1) The exams are correctly constructed, (including the keys)
(2) The exams in the set for each element are different.

We have had occasion to correct problems with keys (typos, etc.) and some problems go back to the Question Pool itself. We accept the exam sets in good faith and administer them as such. Errors occur rarely enough for us to have confidence in the exams as they stand.

As the bumper sticker says: "SH** HAPPENS!"

> I don't know about other teams and VECs, but our VE team has exam sets
> consisting of several exams for each element. Every applicant that comes
> through our group has an index card with the date, which exam element and

> telling me which questions I missed, and going over the correct
> answer; or quickly covering the point(s) the question covered?

What would be wrong with it? In my PERSONAL opinion, nothing. But I don't make the rules. (For that matter, the VEs don't, either, so blaming them is "killing the messenger"!)

From a VE point of view, possibly three things:

(1) Time. If there are a dozen folks taking exams, you can plan on a long session, just giving exams and recording what has to be recorded and filling out the 610s and CSCEs and other paperwork.

Is the applicant willing to wait till all that is over?

If so, IMHO, I believe the VEs should be able to tell them the question numbers (like 3B-4.121 or whatever) then if there is further discussion, it is "offline".

(2) Examiners are not trainers. That's not the purpose of the examination. The examination is intended to assess skills and knowledge, not to teach.

I can give sample exams in a class or a coaching session, but that's training, not an official, creditable exam. We can then go on and discuss what they missed and why.

Someone who is studying on their own can go through all the questions or sample exams and see if they agree with the answer. If they dispute what is in their study material, they can follow whatever steps they deem appropriate.

(3) The rules state what the rules state. Read the rules. IF you think the rules are wrong...[you probably know the rest...]

I believe (not based in fact, I claim no clairvoyance into the minds of the FCC and/or the VECs!) the rule is a continuance of the same rule that applied to some GS-something clerk who used to administer the exams. If you were lucky, you got an "FCC Engineer," but not always.

<<ACTIVATING O.F. MODE>>
(I'm trying to remember the exams I had, and I think I've seen both?)
<<O.F. MODE OFF>>

> where else and see the same questions.

Right. We are really only intending to control our OWN sessions, not anyone
else's. It's potentially more bother than it's worth to try and circumvent it.

> The original posting had to do with VEs who refused to let the exam-
> inee know which questions he/she missed. If you don't give the same
> questions twice, I don't see where it's a problem; even if, as one
> poster stated, the VE's review the correct answers.

The way I read the rules, you only tell them (1) pass/fail and (2) the number
missed ((NOT WHICH ONES, JUST HOW MANY!!)) I'll look at that again. Thinking
as a test-taker, the specific results (what you missed) might be perceived as
a guideline. But as a test-designer, I think the specifics merely point out
areas of weakness.

Whether the rules specifically state that you are NOT to do it (as I thought
they did) or just state that you don't HAVE to do it, I would have to look
again and examine more closely exactly how it is worded.

> As a matter of record, I favor *not* doing this, since I think the
> way the writtens are administered makes it too simple anyway (e.g.
> you can get sets of the exact questions to study, along with the
> answer keys).

Speaking as a trainer as well as a VE, I would be inclined to make a note of
the TOPIC AREAS they missed and encourage them to work in those areas. Whether
you discuss the specific questions at that time might or might not be helpful
in terms of what the person learns. (Unless they are simply parroting "the
answer to question 3B-4.121 is 'C'." as opposed to actually learning the
material.)

For me, ((PERSONAL OPINION HERE, TAKE IT AS SUCH!)) part of the preparation for a test is knowing the material. Not everybody feels that way. <sigh!>

From the standpoint of making sure the tests are correct, of course, we still find mistakes from time to time. It's a benefit to the VEs to make sure the keys are correct. But that should be (ideally) before the test happens.

OBSERVATION: There are good politicians and bad politicians and good cops and bad cops and good hams and bad hams and good teachers and bad teachers and you can expect there are good VEs and bad VEs. We're dealing with people here, and there are as many different personality types are there are different persons.

There are even good test-takers who study and prepare and pass, or if they don't pass, they have a pretty good idea what they don't know, and go on to do something about it-- (the "IGNORANCE IS CURABLE" theory).

Conversely, there are bad test-takers who get upset that the test is not super easy for them. Even though thousands of others have passed the test, because they didn't pass, THERE MUST BE SOMETHING WRONG WITH THE TEST! (the "EVERYONE IS OUT OF STEP BUT ME" theory).

As far as going over the test at exam time? Is it really trying to find out what was missed, or is it trying to catch the examiner? I can't answer that. Each test taker is different. Read the rules. Follow them or change them.

73==> and keep :-)ing.

Actually, they are more correct than you might suppose. All the wireless
LAN products I have seen advertised operate in 902-928 MHz which is also
allocated to...amateur radio, ISM (industrial, scientific, and medical), and a
few other oddball services. It would be legal to build a 910 MHz microwave
oven and I have data sheets for 910 MHz magnetrons for industrial equipment.

It is annoying that cars put out as much noise as they do. I am working on automotive network now and I had to wrap the damn thing in aluminum foil so I could get it to work inside a IBM PC. We have also had trouble with handi-talkies wiping out the automotive computers. By passing, shielding, rf chokes and grounding cure our problems. But Detroit can't afford the $5.00 worth of parts to do this.

The problems are not likely to get better in the short run as some of the stuff has a 16 Mhz clock and generates noise to at least 300 Mhz. It is also extremely susceptible to interference.

My sins have come back to haunt me. I am need to get the computer noise out of a 1990 Bronco. Any and all help is very welcome.

An excellent GPS receiver is the TANS from Trimble Navigation. Very small, low power, and easy to use. Antenna is about 5x5 inches, low profile phased array. The best part is that unlike some of the models made for the boating world (like Magellan), the TANS has an RS-422 port and transmits latitude, longitude, elevation, speed, time, and diagnostic data. Easy to interface. I'm putting one on my bicycle for nav, mapping, and security.

Contact the company at 800-TRIMBLE or 408-730-2900 (they're in Sunnyvale).

I am interested in building a morse code decoder for a Macintosh.
So I am looking for the following:
- schematic for a low cost A/D converter which could send the samples
in serial form for capture via the Macintosh serial port
- reference to articles on algorithms for morse decoding; I am looking for
something that could automatically adapt to varying speed etc...

I am interested in building the converter and writing the program on the
Macintosh (in C) myself, not in buying something ready made. Thanks.

2380. Request for Comments on Automotive Noise (HF)

Newsgroup: rec.ham-radio
Date: 1990-10-26 13:13:16 UTC
From: jhk@SATURN.ACC.COM
Message-ID: <9010261313.AA11410@saturn.acc.com>
Source record: 7340

Gentlemen and Ladies;

I originally sent this message privately to a couple of folks on
the net, but with the recent flurry of conversation on car RFI, I
thought there migth ht be someone with some constructive comments.

You can send your responses to J jhk@saturn.acc.com if you'd like.
Thanks.

original text follows: -----------8<--------------8<-------------------

Gentlemen;

I did not see the text of the original message, but I'm wondering
if you've found a solution to a symptom that I've been hearing
while trying to operate mobile hf ssb.

This past summer I installed a 15 meter monoband transceiver in
my 1985 Chrysler Laser Turbo XT. I immediately noticed that when
the engine was running my overall background noise level went up
to nearly "half-scale" across the entire band (21-21.450 mhz).
This is not ignition or alternator noise; they have distinctive
sounds that I've heard in my other vehicles. I do have an all
electronic dash, but that noise is generally deterministic (e.g.,
happens at specific places across the spectrum) while this is
very, very broadband, and has no "note" component to the sound.
I do have quite a bad birdie from the dash at 21.336, but other
than that this broadband hash covers up anything of a lower level.

I did try operating the radio from sealed lead-acid batteries to
see if the noise was conducted, and it had absolutely no effect
on the level of the noise. It also appears to be entering through
the antenna connector, since it disappears when the coax is
disconnected (so does any desired signal, too, of course!). I
had someone mention a couple of weeks ago that it might be the
fuel pump. I suppose that is possible because it looks like a
small DC permanent magnet motor (with brushes, I presume)
pressurizes the electronic fuel injection system when the engine
is running. My only other "first suspicion" is the injectors
themselves, although they are inductive and I'd think this would
end up being conducted rather than radiated. Does any of this
sound similar to the problems you were having or have solved?

Now, let me put a strange
twist to the story. I've noticed that this noise, or a similar
one that may be masked by the former one, *increases* noticeably
when I am driving on concrete highways versus blacktop asphalt!

The only thing that I can ascribe this to (if it is indeed the same noise generator) is that the car is somewhat better grounded through the tires to the asphalt surface than to the concrete (asphalt = tar = carbon black = "relatively" conductive surface vs. concrete = silicon = insulator). I use very low profile, very soft compound (lots of carbon black) tires (hey, it is a sports car, after all!). Anyhow, it *is* strange. I have heard of "tire static" in some old handbooks, but of course the wideband noise is there whether the car is rolling or not. Interestingly, also is the fact that the turn signals "modulate" the amplitude of the noise. Very strange.

I have the shop manuals on the car, which shows that the fuel pump is on the top of the gas tank. It appears that the first place that I could attempt to easily bypass it is under the rear seat. I'd like to do it at the source, but that may not be physically possible. If I could just get the noise down 15-20 db, that would probably be plenty. I'd appreciate any info if this sounds remotely familiar to your situation. Thanks much, and reply by email, fax or phone is fine.

John...

|>start splattering at that point, but not before.
|>
|>If anyone knows the straight poop on this, I'd appreciate hearing
|>about it. Going off the air for twenty years and then coming back
|>as a "lid" is just what I need.

An interesting question. I read what Kenwood had to say in the TS-440 manual
and eventually got on the air and asked some people to comment on my signal as I
adjusted the the controls. Typically (hey, Derek, did I spell that right? I
can't spell check in the editor with my system.) they reported the best signal
with my ALC meter well past the fat red zone. That left me wondering if Kenwood
meant that I shouldn't exceed the fat red zone or the little red line that ran
under it (which I assumed was purely decorative.) The signal with no bounce in
the meter at all, or bounce kept in the "pre-fat red zone" area was described as
"awful" and "muddy" even with the processor on.

What's a ham to do?

|>

Ptui.

I'd rather use "it" than something like that. Although it's probably easy to
re-write the text to avoid the question completely "Patrick Taber, Operator of
station KC1TD has provided satisfactory evidence of having met the incredibly
low criteria of the Worked All Day Award." works for me just as well as it would
for Patricia Taber (ignoring the callsign.)

I don't think there was any sinister purpose in the wording of the awards. In
some cases it was thoughtlessness, and in others it was probably blissful
ignorance that a problem existed. Countries where English isn't the native
language probably still use the 50-year-old english textbooks (some of which
still teach the use of "thou") and it wouldn't occur to them to question the
assertion that proper English always uses "he/him/his" when the sex of the
person spoken about is unknown. Paired with the custom of assigning gender to
words in many languages it would probably never occur to those people that there
might be something controversial.

First we need to solve the problem (neuter pronouns) then we need to change the
text books. Then we have to wait the 100 years or so for it to propagate.

Yes you are expecting too much. :-) Seriously, you could carefully
retune the frontend to favor the lower frequency range. This would
probably make it impossible to monitor National Weather, but if
aircraft frequencies are important enough to you, it might be worth
it. Life is a compromise.

You don't really need A/D. You just need to put a level sensor in the audio line -- goes high when the audio exceeds some threshold you set to remove the noise. An op amp circuit should be able to handle that pretty easily. Then you have to write software that will calculate the signal high to signal low time and figure out what's dots and what's dashes. Not as trivial as it sounds with hand-sent code, though you'll get a better hit rate off people who are using keyers than straight keys or bugs.

VVV was also a CW test signal during WWII (V for Victory, like the first three notes of Beethoven's 5th Symphony). Wonder what the Germans and Japanese used?

RYRYRY in baudot is a "worst case" test pattern which exercises all the bits alternately; the ascii equivalent is U*U*U*. Perhaps they are more relevant to mechanical teletypes.

>really appreciate the art form.

Hey, no problem! I may have struggled terribly hacking my way to 18 wpm, I've been stuck there for 25 years :-(, but I can appreciate that others have found their ham radio niche in working CW. I hope people understand that I have only railed against those with a holier-than-thou attitude that one is not a serious ham unless one can do high speed CW and those who claim that CW is the most efficent communications modulation. I don't believe either of these claims and will probably jump in again if I see them come down the net.

Now while we're on the subject of CW, I've come to realize that one of the problems I have copying CW is that I am unable to write faster than 18 wpm with pencil and paper and that I can't copy at all in my head. I have tended to believe over the years that some musical talent must be required to master high speed CW since most of my ham friends who can do high speed CW play a musical instrument. I have read lately on the net that some people with no musical ability at all have mastered high speed CW. Ok, what's the secret besides practice? I've practiced both on air and off for years with no improvement. How do you copy in your head? Even after all these years, I have to concentrate so hard on each letter sound that I can't keep the words in memory. To find out what I just copied, I have to go back and read the paper. Anybody got any hints for a ham who is eligible for the QCWA who can not break the barrier?

ALC means Automatic Level Control. A meter indication in the normal operating range does not mean you are splattering, but that the ALC is operating properly. If the meter isn't moving at all, the output power will probably be far less than the capability of the transmitter. Adjust the mic gain for a meter reading in the normal range, but be careful not to exceed that range on voice peaks. There is some evidence that the 440 is quite unforgiving when overdriven.

sounds like the whining "me" generation to me.........

> As for CW bashing, I really haven't seen any. I have seen a lot of
> people, like me, asking the above, what makes CW so special? And I,
^^^^^^^^^^^^^^^^^^^^^^^^^^
> like many others I suspect, am still waiting for an answer. Ham radio
> is a hobby, and not everyone is interested in all modes. Why jam one
> specific one down people's throats?

WAIT NOT LONGER.....I'm suprised that none of the old-fart beat me
to it!!!

What is so SPECIAL about CW....

1) EFFICIENT. CW is conservative of band spectrum. CW is "THE" QRP
mode. CW is "fault-tolerant" as a digital mode. The good
old gray-matter processor still beats the best CPU algorithm
ever written for pulling meaning out of the mud.

2) SIMPLICITY. CW is the simplest form of communications to build a
transmitter or receiver for. New hams can be encouraged to
build their own equipment for CW without intimidation or
excessive cost. In the event of an EXTREME emergency, this
is the easiest mode to "Improvise-and-communicate" with.
CW requires no modulation, modems, software, ...

3) FRIENDLY. CW at 15wpm+ lopes along at an easy conversational pace
allowing one to think of something interesting to say while
sending. CW even has a parallel to the smiley .... ..
CW may be used by the speech impaired, sight impaired, and
the hearing impaired equally without extensive adaptation.
It is difficult to scream, rant, or rave in CW.

4) HISTORIC. (this is where the flames will come from ;-) Samuel Morse
and his code have been historically significant to the
evolution of Amateur radio. It is also the only digital

mode easily recognized by non-amateurs in movies etc. CW has its roots in pre-telephone telegraph communications. How can children play "cowboys-&-Indians" without a rail-road telegraph operator??

5) REWARDING. Communicating via CW is a "SKILL" and thus rewards the operator with a sense of accomplishment and satisfaction.

Numbers 3 and 5 are my personal favorites. The simplicity of home-brewing CW gear should be particularly important to all those who are looking for various ways of enticing younger future old-farts into the hobby. If you've ever built your own gear and made a contact with it......you would know what I mean.

KM4JN, middle-aged-old-fart-that-does-not-oppose-the-communicator-class but-KNOWS-somehow-it-will-not-acheive-the-expected-results-and probably-WILL-cause-insurmountable-problems-for-the-future,

Herbi (smileys implied).

What? One minute solid copy or answering 7 of 10 multiple guess questions
on received text is a test of on-the-air procedures? I hope not!

>CW is probably more common to all amateurs than any other particular
>mode. One could argue that this is *because* of the international
>CW requirement. Yup, that's right. Think of CW as having the same
>function in amateur radio as American English has in the US. It's the
>"watering hole" where the packeteers can meet the FSTVers.

CW is a MODULATION method not a LANGUAGE! Whatever language you choose
may be encoded into CW. You may communicate in the Spanish LANGUAGE via
CW modulation for example. If you mean a common MODULATION method, then
consider AM or FM. They're certainly simple enough to receive or generate
and every ham should understand the principle. A separate test on talking
and listening might be a good way to test on-the-air procedures. :-)

When CW was the only modulation method, many hams and commercial radio
users were feverishly experimenting to develop voice communications.
When voice modulation became available many hams and most commercial
users switched over because of the increased speed of communications
and the ability to detect subtle nuances of tone and expression that
it allowed. CW still has a place in the radio hobby because some find
it fun to use a traditional mode emulating the way their ancestors
communicated. Additionally CW allows cheap weak signal play for the DX
game. For serious professional weak signal work such as is done by the
Deep Space Network other techniques are used. CW is as valid a modulation
method as AM or FM and deserves as much attention on the exam as AM or FM
modulation receives.

Hi Bruce,

Yes, it was your comment I was reading. Sorry if I misinterpretted your intention. I think I understand it now. I'm wondering why the VEs don't normally go over the test with interested examinees? Is it because a lot of people just don't care whether they missed a few as long as they pass, or is it because it's always crowded during these sessions and it would be a zoo if everybody wanted to go over their papers in detail?

I really do like the VE program. When I took the General in 1963, I was still wet behind the ears and going to the FCC office in San Fran for the code and theory was a little intimidating. This is a much better system and if I can contribute to its success, I would like to do so.

Thanks again, Bruce,

$390 Yep, the difference between a man and a boy is the price of his toys. :-)

>I'm wondering, also, if you can have a few hundred feet of control cable
>before the meters become inaccurate.

I'm using 100 feet of control cable with no problem. The power wires are
14 gauge and the other wires are 18 gauge. The wire has a fixed resistence
and the sense current is small so, other than the original calibration routine,
the length of the cable should be unimportant.

>Perry/KF0CA
```

Three cheers for those "paragons of patience!" I finally met one last week. I've been licensed for one year now and had given up CW after the first month of nothing but frustrating contacts with people who invariably sent faster than I could receive.

So here's the challenge to all of you OFs with Extra tickets who aren't yet as jaded as Perry: <<-- joke alert, joke alert :-)

If CW is really so neat and fun and worthy, then getcher VFO into the novice sub-bands, turn off your Kilowatt (still illegal in all novice sub-bands except 10m, no?), crank your keyer down into the "barely endurable" 5wpm range and answer the slowest, most slimy, most despicable, most awkward CQ you can find. Is he in the same state? Hey! That's great! That means he won't have any trouble picking your signal out of the noise! Does he send "RST 603"? Even better! Now you KNOW your talking to a real beginner! :-)

Thanks to those of you who actually do this once in a while. Running into one of you sure changed my view of CW. (Yes, I still consider it archaic, but I now allow for the possibility of it being fun too.)

Nope! The fence is not high enough for the drive-in movie, and the
people at the next table should just sut-up and stop all the acoustical
interference. :-)

>
>Mike O'Brien, KC6OJW/AA
>obrien@aerospace.aero.org

I have a 440 and a 950. I do remember clearly that the TS-440 manual says
that the Mic gain should be adjusted such that voice peaks do not exceed
the ALC area marked by the red bar.

I think the source of confusion is that what I recall reading in one of
the ARRL study guides (maybe the Tech book) that Mic gain should be
adjusted for "slight" ALC meter movement. "slight" in not a quantative
term.

In SSB your output signal is dependent on the modulation. For example,
no audio - no transmitter output. Put a 1-2 Khz pure sine wave in through
the Mic jack (at the proper level) and you'll see "full power". Using
an external wattmeter I usually see about 90-95 watts out with the sine
wave. Voice is a different matter. I usually see about 45 watts out
avg. for my speaking voice. Your mileage may vary.

If you don't crank up the Mic gain such that you peak the ALC meter at
the end of ALC zone you will be putting out some power but not full power.

I usually run my TS-440S and Kenwood TS-950S with Mic gain / processor
levels peaking the ALC meter at the end of the marked zones. This gives
me full power out and, from signal reports, no voice distortion.

==> One thing I dont like about the 440 is that it has no "power" control.
The TS-140s and the TS-950s both have this control and it is useful
for "powering down" after I've established a QSO after a CQ.

You can probably accomplish the same thing "powering down" on the 440
by reducing the Mic gain. But, I don't think its the same "mechanism"
the 140 and the 950 use to control power output. Maybe someone can
give me the scoop on this...

> The guys on-air said, "The [ALC] meter. . .
>needle shouldn't move at all. If it does you're going to splatter."

If short, I think the guys on the air are "wong". It will work, but
you wont be driving the TS-440 to its 100 Watts rated output.

Makes you not want to even buy a house.

But I bet you will likely find a correlation between lots of CCR's and
the existance of a home owners association you have to take part in.

When telling a real estate agent about your restrictions on a house
search, you could mention that you don't want to be involved in any
home owners associations as a condition of the sale, due to the legal
obligations that gives you. The agent may be able to effectively
select property better suited to hams (if there is any) without ever
knowing exactly what particular CCR you are trying to avoid (in case
you'd rather not get into explaining it).

Actually it is ages old. It started simply as agreement terms between
buyer and seller, and I suspect early on the terms explicitely worded
that the buyer was obligated to pass on all the terms to the next buyer.
It was probably subsequent to that that the courts (or whoever) established
the concept of them running with the land, to simplify all the terms.

brent@network.ucsd.edu (Brent Jones) writes:

>FCC Rules part 97.205 paragraph E sentence #2
>(e) ..."Limiting the use of a repeater to only certain user stations is
>permissible."

>Self explanatory.

But it does not necessarily have a unique interpretation. To me this
rules says that if you implement means to prevent my access to your
repeater, that you will not be in violation of FCC rules.

However if you put a CTCSS squelch on the input, have you actually
implemented such a mechanism of closure? I think not, since CTCSS
encoders are prevalent, and the number of codes is so small (38).
You could try an unusual tone or maybe DTMF to bring the machine up.

How about Data's computer access code from ST:TNG? I didn't get it
recorded, so you could effectively keep me out for a few days.

>If the front panel switch was turned off on the repeater, and you drove
>up the hill and turned it on, you would have also made the system "NOT
>CLOSED" for you... His intent there is that the repeater not be used
>also by you, or in this case anyone else. If your definition of a

>it means a repeater that has use limited to certain users. And you have
>not become one of these designated users by figuring out the repeater
>PL, Touch Tone, digital squelch or whatever system implemented to hinder
>unauthorized use.

But we don't agree on this. Has there been any case law that defines
the proper interpretation of 97.205(e)(2)?

Actually, I probably do agree with you that someone getting into a
repeater that they are not welcome on is bad, but I do not see where
it is illegal. I would be willing to work with you in rewriting the
rules to change this.

There is also another argument to deal with as well. In certain areas,
even the 70cm band is "full" with regard to coordination yet nearly all
of the coordinations are to repeaters that make virtual very little use
of the spectrum by virtual of their closedness (to a group that is).

Perhaps it would be a good idea to go back to the band planning process
and designate portions of the repeater subbands for the various kinds of
repeaters. At least 1/2 of the 70cm repeater subbands should be available
to repeater operators running open repeaters. The term "open" in this

context can still mean "with access" controls, but that those who can get
the access can be anyone (we want to keep out the LIDs, right?).

>Agreed. And if a repeater is operating out of coordinated band plans,
>it must accept the consequences. And people operating in the repeater
>sub-bands, say simplex on a coordinated repeater output, also must accept
>that a repeater may key up on top of them.

Agreed.

>Or all those who are dissatisfied with what's on 70cm, move to 23cm...

Actually all this is really a problem of what amateur spectrum is for,
and where coordinators derive there authority to make decisions that affect
far more than just repeater owners (such as would be repeater owners because
the coordinators "filled" the band up with such waste as a bunch of repeaters
that hardly get any use).

2409. Re: extra callsigns

Newsgroup: rec.ham-radio
Date: 1990-10-26 22:33:32 UTC
From: phil@ux1.cso.uiuc.edu
Message-ID: <1990Oct26.223332.25810@ux1.cso.uiuc.edu>
Source record: 7369

The fact that 2x1 calls for Extra are running out is a concern. These are the incentives to upgrade to Extra:

1. Extra privileges on HF
2. Space operation privileges
3. Nice callsign

My response to these:

1. So what, I don't work HF.
2. Everyone gets a waiver anyway.
3. This is all that's left.

So why don't I hurry up and just get my Extra right now? For one thing I only have so much of my time to spend on ham radio and it goes for the "codefree" fight which is not over. Secondly, with the threat from the FCC that the Technician class may be an extinct one, I am going to hold onto mine until the outcome.

What we need is for the FCC to start recycling unassigned calls.

>substantially from the ARRL bandplan; sometimes to pack more repeaters in,
>and sometimes to make them feasible (take the ICOM RPT1210 1.2GHz repeater
>with its 20 MHz split).

Icom does make that repeater available with a 12 MHz split.

The bandplan that is appropriate is of course the local one. The ARRL
national one is a suggested starting point. Local needs do vary and so
the local bandplans vary as well.

>>The PROBLEM is that there are many (and this may be MOST of them) closed
>>repeaters are just there to serve a clique. They get very little use.

>That seemed to be the case out in nineland, but not here. It really depends
>on the size of the group that runs the closed repeater. Given the ham
>population density, we tend to see far more people on our closed machines
>out here.

When I visited 6 land, I found FAR LESS usage of all the repeaters. I guess
everyone was hiding on the closed repeaters and simplex frequencies.

>>I don't want to eliminate the idea of a closed repeater. There is a place
>>for closed repeaters. But I think there are too many of them around right
>>now in the 70cm band.

>Probably due to all of those surplus Mastr IIs and Micors. 2m in Chicago
>is heavily PL'd, as I recall.

PL/CTCSS does not consitute a closed repeater. CTCSS is useful to block
out intereference. The 146.76 machine in Chicago recently became PL'd,
so that means everyone who gets in has to have that PL tone on. That gives
us a chance here in Urbana-Champaign to end our problems with their high
power users and band openings by putting on an anti-PL for the same tone.
So if the that tone is present, WE WON'T key up.

>>All "clique repeaters" should move to 23cm.

>Odd. Stanford runs an open repeater on that band (1291.5 -20M, 88.5Hz, W6YX/R)
>so I'm not too sure I agree with you. I did argue the case for keeping it
>open (not that there was much opposition), given the nature of the club,
>and of the band. We went "up there" in part to publicize the band, and
>I don't think that would have worked in the case of a closed repeater.

CTCSS controlled and open. Yes, it takes an open repeater to really
contribute to activating a band.

My concern is where all the Communicators will go. If they get 2m and 6m
then they get distributed out better. If they are stuffed above 220 MHz,
then expect some major problems on 70cm. But if you can encourage them
to jump all the way to 23cm, great.

>Personally, I'd like to see open repeaters as the default, but over the years,
>I've come to sympathize with others who get tired of having their conversation
>disrupted by some bozo with a nebulous comment. Also, smaller repeater
>communities mean that I can keep my radio on at my desk; chances are that
>when someone comes on, I'd actually want to talk to them.

An "open" repeater does not mean there cannot be access controls. You can
put on those controls, and then tell MOST people how to access. Just don't
tell the BOZO's. Of course CTCSS is not it.

>In the end, both open and closed repeater systems have their merits, and
>the decision to close a repeater depends on the nature of the repeater
>community; only the trustee is in a position to make that judgement.

With the above definition of "open", I would suggest amending the band plan
to provide for some portion of the repeater segment to be "all open only".

I have to throw my $0.02 worth in on this one. I think the VVV on CW was/is to help operators get the dot/dash ratio correct. The old semi-automatic keyers (a.k.a. 'bugs') send dits automatically but the dahs have to be keyed manually. Since the correct length far a dah is three dits, a V is a good character to use to get the ratio correct. These days, electronic keyers do it all for you, although I have heard lots of CW ops who seem to somehow have screwed it up.

BRUNEI, V85. V85OO, OPERATOR BOB, N2OO, WILL BE ACTIVE NOVEMBER 12
TO 16, MOSTLY CW ON 80 THROUGH 10 METERS.

COMOROS, D68. D68VT, OPERATED BY K5VT AND N6ZV DURING OCTOBER 23 TO
31, WILL BE LOOKING FOR YOU ON 9 BANDS, 160 THROUGH 10 METERS PLUS
AO 13. DL7FT IS DUE IN D68 SOON. D68WB SKEDS HIS QSL MANAGER WV4F
ON 14152 KHZ AT 0330 UTC DAILY.

EAST KIRIBATI, T32. T32IO OPERTIONS FOR OCTOBER HAVE BEEN CANCELLED.

JUAN FERNANDEZ, CE0Z. IF YOU CAN NOT WAIT TO WORK CE0ZZZ NOVEMBER
10 TO 18, LOOK FOR CE0ZIG WHO LIKES 17 AND 12 METERS AROUND 2200 UTC.

KERGUELEN ISLAND, FT8X. FT8XA LIKES 14256 KHZ AFTER 0000 UTC AND
14015 KHZ AROUND 0400 UTC. RAFIK WILL WORK ALL BANDS IN THE CQWW
SSB CONTEST THIS WEEKEND. QSL VIA FD6ITD. FT4XG IS FREQUENTLY
FOUND ON 10 METERS AT 1200 UTC. QSL VIA F1AAS.

LIECHTENSTEIN, HB0. HB0NL MAY BE FOUND ON 7005 KHZ AT 0100 UTC AND
14020 AND 21015 KHZ AFTER 1300 UTC. QSL VIA HB9NL.

MALAGASY REPUBLIC, 5R8. IK2GNW WILL ATTEMPT TO ACTIVATE 5R8 BEFORE
THE END OF THE YEAR. DL7FT IS REPORTED TO BE HEADED TO 5R8 AFTER THE
D68 OPERATION. K5VT, EX 5R8VT IS NOW IN D68. LLOYD AND IRIS PLAN A
```

VISIT THERE AS WELL. THE MALAGASY PTT WILL BE VERY BUSY NEXT MONTH.

MARIANA ISLANDS, KH0. THE JCCC BOYS PLAN TO SET A NEW OCEANIA MULTI MULTI RECORD IN THE CQWW SSB CONTEST THIS WEEKEND. SIGNING KH0AM, 14 OPERATORS WITH 7 COMPLETE STATIONS WANT TO QSO YOU ON AS MANY BANDS AS POSSIBLE. RTTY AND CW OPERATION WILL TAKE PLACE BEFORE AND AFTER THE CONTEST. QSL VIA JE1CKA. PLEASE SIGN YOUR FULL CALLSIGN, ONE TIME ONLY. KNOW YOUR WAZ ZONE NUMBER.

MALPELO, HK0. HK0TU OPERATIONS ARE ON SCHEDULE FOR NOVEMBER 3 TO 8. SIX BANDS WITH 20 OPERATORS WORKING CW, SSB AND RTTY. QSL VIA HK3DDD.

MOZAMBIQUE, C9. C9QL HAS BEEN ACTIVE ON 10, 15 AND 20 METERS. LLOYD AND IRIS WILL REMAIN THERE UNTIL NOVEMBER 5. WB0NAA WILL BE STATIONED THERE UNTIL JUNE, 1992. SO FAR, JIM HAS HAD NO LUCK IN SECURING A LICENSE.

ST. PAUL ISLAND, CY0. AFTER 2 DAYS DELAY IN LANDING, DUE TO HIGH SEAS, PATRICK AND RON ARE QRV AS CY9CF. THEY WILL BE ACTIVE ON 9 BANDS, 160 THROUGH 10 METERS ON SSB AND CW. THEY WILL OPERATE RTTY ON 15 AND 20 METERS ONLY. QSL VIA FP5DX.

SOUTH GEORGIA, VP8. VP8CDJ IS OPERATING 20 METER SSB ON 14255 KHZ FROM 2300 TO 0000 UTC. QSL VIA GM4KKO.

SOUTH SANDWICH, VP8. VP8SSI BY WA4AQS AND COMPANY HAS BEEN CANCELLED FOR THIS YEAR. TRANSPORTATION COSTS HAVE GONE UP 25 PERCENT DUE TO RISING FUEL PRICES. THE SHIPPING COMPANY HAS RETURNED THEIR UNCASHED CHECK. TRANSPORTATION ALTERNATIVES ARE SLIM TO NONE FOR THIS YEARS SHORT ANTARCTIC SUMMER.

TONGA, A35. A35XK IS QRV. QSL VIA WA6ZEF.

USSR, UA0K. UA0HAE/UA0K OPERATING FROM WRANGEL ISLAND IS QRV ON 14020 AND 21015 KHZ. QSL VIA UB4MM.

WAKE ISLAND, KH9. AA4NP/AH9 IS NOW QRT. AH9AC HAS BEEN WORKED ON 14226 KHZ AT 1030 UTC.

WEST KIRIBATI, T30. T30JH, BY JACK, VK2GJH IS QRV. TRY 28520 KHZ AFTER 2200 UTC OR 14222 KHZ AT 0400 UTC. AR

I didn't say there were not any such clubs. Notice that I did include
the clause to refer to such things.

A better name is "The Scam". That sounds just like what it is. Hmmm,
it even sounds just the same as one of those churches I hear about every
now and then that takes people's money. Clearly it is just some people
who are power hungry and starving.

Sorry about you losing your $25. We've all made mistakes in life even
where we had no way of knowing in advance. But $25 is a cheap lesson
on how a lot of other people live.

You can copy code that is 20db BELOW the noise floor?

>2) SIMPLICITY. CW is the simplest form of communications to build a

Very very few people who use the frequencies I use have any equipment that
can copy it. Just try building a rig that can transmit CW in such a way
that any of the radios other than my R-7000 can copy it. All my other
radios use just FM.

>3) FRIENDLY. CW at 15wpm+ lopes along at an easy conversational pace

Thus is a good argument in favor of using CW. With arguments like this,
we don't need a code test at all for any class license. Everyone will
be flocking to use this wonderful mode where everyone has something
intelligent to say, and there are no screams, rants, or raves.

>4) HISTORIC. (this is where the flames will come from ;-) Samuel Morse

> operator??

Didn't Samuel Morse predict that there would be a telegraph key in every
home with 50 or 100 years? Hmmm. I guess people just like the phone better.

>5) REWARDING. Communicating via CW is a "SKILL" and thus rewards the
> operator with a sense of accomplishment and satisfaction.

Yes, it is rewarding. Too bad I didn't get to realize this while studying to pass a test that was being forced upon me. Too bad lots of non-hams will never even be exposed to the possibility that they might even like code, just because they won't get into ham radio until it sheds itself of irrelevant tests.

> KM4JN, middle-aged-old-fart-that-does-not-oppose-the-communicator-class
> but-KNOWS-somehow-it-will-not-acheive-the-expected-results-and
> probably-WILL-cause-insurmountable-problems-for-the-future,

That's why I petitioned, and commented, to the FCC for a different structure of codefree license classes, as the Communicator did not really address the problems, and the FCC proposal appears to be trying to destroy ham radio (and get a few hundred MHz of free spectrum to sell as well).

I think what is meant here is that CW is more than just English or Spanish.
There are a number of coded abbreviations, Q codes, and other things, that
can help the communication process. You actually can carry on a QSO with
another station without having to have the understanding of the other voice
language. And of course the accents are gone (unless you consider fist).

>When CW was the only modulation method, many hams and commercial radio

CW definitely has its place in ham radio. But as long as it is required
of all hams, ham radio itself may not have a place in the spectrum.

**** UoSAT-OSCAR-11 BULLETIN 24 October 1990 ****

UoSAT MISSION CONTROL CENTRE
University of Surrey, Guildford, Surrey, GU2 5XH, England

** AO-13

Command Stations performed magnetorquing procedures near perigee of orbits on
October 15-17. The new transponder schedule is as follows:

Mode-B : MA 000 to 095
Mode-JL: MA 095 to 125
Mode-LS: MA 125 to 130
Mode-S : MA 130 to 135
Mode-BS: MA 135 to 140
Mode-B : MA 140 to 256
Omnis : MA 220 to 040

This schedule is expected to continue to 261290. The spacecraft attitude is:

BLON = 180 and BLAT = 0

** AO-10

AMSAT-OSCAR-10 appears NOT TO have been receiving sufficient solar panel
illumination to support Mode-B transponder operations. Both beacon and
transponder signals show signs of FMing. Until further notice please DO NOT
use AO-10's transponder. AO-10 may be able to to support Mode-B transponder
```

operation in November.

** AO-16 PACSAT

The microsat BBS has been tested on the ground engineering unit, and is now ready for uploading to AO-16. The satellite BBS software was written by Jeff Ward, G0/K8KA, at UoSAT and was ported to the microsats by NK6K. The porting was easily achieved, as there are only 10 lines of code that are different between the UoSAT version and the Microsat version. A lot of effort went into the design of the BBS, operating system, and other support code to make that possible. Once complete, the following elements will be available:

256k file system:

This is just half of one of the four available banks of bank switched memory. The more complete file system using all four banks and the 6MB mass memory will be uploaded after more testing.

FTL0 file server:

This implements the protocol described in the FTL0 document, available on CIS, the 9th ARRL Networking Conference proceedings, and elsewhere. It allows file uploading, downloading, and a simple directory display. It requires the use of software at the groundstation: a simple version, called "PG" has been written by Jeff and will be on CIS soon.

Broadcast server:

This implements the broadcast protocol as described along with FTL0 and has been running for several weeks on UO-14, and a few people have rolled their own receive program, at least one written in BASIC. A simple version, called "KISSUI" has been written by Jeff and will be on CIS soon.

After this is loaded, the following separate programs will be running on AO-16:

Kernel - Operating system - NK6K/Quadron
AX25 - AX25 driver - NK6K/WB6YMH/Quadron, pd on a KA9Q AX25 implementation.
PHT - Spacecraft control, power management & program loader - N4HY/NK6K
AARTD - AART driver - NK6K/WB6YMH
MFILE - File system - G0/K8KA/UoSAT
FTL0 - File upload/download - G0/K8KA/UoSAT
PBP - File broadcaster - G0/K8KA/UoSAT

** $BID **
Please use BID $UOSAT.1024 for PR BBS use.

>what about the opportunity to serve as a volunteer examiner?

OK, I forgot about that one. Do we need any more VE's?

>and what sort of guarantee do you have of getting a ``nice''
>callsign? you may get a shorter but really awful one.

Well, shorter is nicer. I would like to get one where people are
NOT ribbing me for working for a radio station in Chicago :-)

You can get bad call in any group. If you get a good call in one
then you may be wise to stick with it. I really don't care for
an N9xxx call, so maybe, just maybe, I'll go with an advanced call
as there seem to be plenty left. I will have to hurry or else end
up waiting for a while:

> > 9 WV9Q KE9ZF N9KDV KB9FNS

since to me, KF9xx is OK, K[GH]9xx is not, and KI9xx is fine, too.
Actually I think I might like KI9xx better so there is yet another
reason to "put it off" :-)

Once I get my neato advanced call, then I can upgrade to Extra, not
check the little box for a call change, and become YET ANOTHER VE :-)

2422. Re: (none) (really: STS35)

Newsgroup: rec.ham-radio
Date: 1990-10-27 03:54:03 UTC
From: karn@envy.bellcore.com
Message-ID: <1990Oct26.235403@envy.bellcore.com>
Source record: 7282

Regarding the scheduling of the STS-35 SAREX QSOs:

At the AMSAT annual meeting in Houston last weekend, Ron Parise (WA4SIR) explained in detail the reasons behind the choice of orbit for STS-35 and the timing of the SAREX QSOs. What follows is from memory, but I believe it to be accurate...

The payload capacity of the shuttle depends on the inclination of the orbit. Maximum capacity coincides with a due-east launch; since Cape Canaveral is at 28.5 degrees N longitude, this produces a 28.5 degree inclination orbit. Since there was no primary payload (ASTRO-1) requirement for a higher inclination, 28.5 degrees was chosen.

The orbital altitude is a tradeoff between "shuttle glow" (at lower altitudes) and free electron density (at higher altitudes). Shuttle glow occurs when the shuttle passes through and ionizes the rarified atmosphere at high altitudes; much of it is in the ultraviolet, and this generates an undesired background for the ultraviolet telescopes. Hence you want to go to a higher altitude. On the other hand, going higher (at the altitudes in question) results in a higher free electron flux, and this can interfere with the more radiation sensitive instruments on board. As a compromise, an altitude of 190 nautical miles (350 km) was chosen. [There's another consideration: the higher you go, the lower the shuttle's payload capacity. Ron didn't mention this one, so I assume it wasn't an important consideration.]

The time of launch (late night) was chosen such that passes over the South Atlantic Anomaly would occur in daylight. (The South Atlantic Anomaly is a region where the earth's radiation belts come unusually close to the surface as a consequence of the offset position of the earth's magnetic field). The trapped-particle radiation in the Anomaly cause upsets in the detectors, and it was felt that it would be better to have these occur during the daylight passes when observing would already be restricted by the presence of the sun (some observing can occur on the day side, but the telescopes must stay more than 45 degrees away from the sun). Night side passes will therefore yield prime viewing, uncontaminated either by sunlight or passage through the South Atlantic Anomaly.

The specific time of launch was chosen as the earliest time that there would be daylight at the trans-Atlantic abort sites in western Africa.

The time for Ron's in-person QSOs is restricted to the two hours before and the two hours after his 8-hour sleep periods. Since these have already been planned out well in advance, he has been able to

determine where the shuttle will be during these intervals.
Unfortunately, it won't be near the continental US. That's the reason for
the inability to schedule real-time QSOs with schools (or other sites)
in the US. The packet robot may be active during these times.

There's one more complication. The Astro-1 mission is a long one, and
hydrogen and oxygen supplies for the fuel cells will be marginal. The
SAREX payload was therefore a somewhat unwelcome addition to the
shuttle's electrical loads. So it may not operate full time - even the
packet robot may not be operating at certain times.

I suspect that more info may appear in upcoming AMSAT bulletins.

Phil

In article <425@ssc.UUCP>, tad@ssc.UUCP (Tad Cook) quotes K1ZZ:
|> The number of new licensees will exceed 26,000, a substantial
|> increase over the previous year. [...]
|> Despite these figures, we're probably going to hear the
|> 'Amateur Radio is dying' refrain from some quarters. It will be
|> interesting to watch how the gloom-and-doom folks explain them
|> away."

The November 1990 QST (just arrived) lists 110 Silent Keys with US callsigns. This appears to have been a slow-to-average month for that column, but if you extrapolate that to the whole year, that's a minimum of 1320 US hams dying each year. So that's a net growth in 1990 of not more than 24,680 amateurs. But more importantly, we have no way of knowing how many other licenses would have expired in 1990 if it weren't for the change to 10-year license terms a few years back. Nevertheless, even if you ignore that factor the annual growth rate is no more than about 5%, a heckuva lot lower than the growth rate in, say, cellular telephones.

Why, I even get a better rate of return than that on CDs at the local bank... :-)

The Silent Keys column of QST should not be taken as a reliable indicator of
the rate of mortality amongst amateur radio operators in general. No doubt
MANY licensees expire without notice to the ARRL.

2425. VVV

Newsgroup: rec.ham-radio
Date: 1990-10-27 13:54:16 UTC
From: PJML@ibma.nerc-wallingford.ac.uk
Message-ID: <01.Nov.90.14
Source record: 7285

VVV is often sent as an 'idle' message when a link is not being used
to handle traffic. Coast stations that still use CW frequently send their
callsign too; 'VVV de DHJ' for example.
Stations like this are a great way to pick up the code, as they repeat
the same pattern for ages (so you get the rhythm of the letters).

RYRYRYRY is the RTTY test signal; worst combination of 0's and 1's for
a mechanical Teletype(c) to reproduce; it was once possible to get a
'Telegraph distortion measuring set' that displayed a helical timebase with
bright dots to represent the start & end of each element; you had to fiddle
with the mechanics of the TTY to get all the dots lined up vertically
on successive turns of the helix.... RYRY gives a nice cross on the
old CRT-type tuning scopes. Unfortunately, such things have become
largely obsolete, like the tuning-forks, spring tension-gages, feelers
(and grease/oil!) that were needed to maintain the mechanical TTYs.
These TTY-maintenance toolkits were often beautifully presented in
felt-lined inlaid hardwood cases... ITT-Creed, Teletype corp. etc.
charged plenty for them too.
Another test often sent by CW operators (and many of the 'mechanical-CW'
machines on the commercial bands) is just a single letter ('C' seems
popular) repeated over and over.

=========

MONDAY OCTOBER 29, 1990

SpaceNews originates at KD2BD in Wall Township, New Jersey, United States.
It is published every week and is made available for unlimited distribution.

* DOVE NEWS *
=============
The following message from N4HY was recently carried on DOVE-1/OSCAR-17:

DOVE-1>BRAMST <UI>:
The new file system will be loaded to PACSAT and BBS operations will commence
in the next couple of days. Upon testing file system there, DOVE will be
reloaded. This will occur next week. 73 de BM Oct. 18

* PACSAT NEWS *
===============
The MicroSAT BBS has been tested on the ground engineering unit, and is now
ready for uploading to AO-16. The satellite BBS software was written by Jeff
Ward, G0/K8KA, at UoSAT and was ported to the microsats by NK6K. The porting
was easily achieved, as there are only 10 lines of code that are different
between the UoSAT version and the Microsat version. A lot of effort went into
the design of the BBS, operating system, and other support code to make that
possible. Once complete, the following elements will be available:

256k file system:

This is just half of one of the four available banks of bank switched memory.
The more complete file system using all four banks and the 6MB mass memory
will be uploaded after more testing.

FTL0 file server:

This implements the protocol described in the FTL0 document, available on CIS,
the 9th ARRL Networking Conference proceedings, and elsewhere. It allows file
uploading, downloading, and a simple directory display. It requires the use
of software at the groundstation: a simple version, called "PG" has been
written by Jeff and will be on CIS soon.

Broadcast server:

This implements the broadcast protocol as described along with FTL0 and has
been running for several weeks on UO-14, and a few people have rolled their
own receive program, at least one written in BASIC. A simple version, called
"KISSUI" has been written by Jeff and will be on CIS soon.

After this is loaded, the following separate programs will be running on
AO-16:

Kernel - Operating system - NK6K/Quadron
AX25 - AX25 driver - NK6K/WB6YMH/Quadron, pd on a KA9Q AX25 implementation.
PHT - Spacecraft control, power management & program loader - N4HY/NK6K
AARTD - AART driver - NK6K/WB6YMH
MFILE - File system - G0/K8KA/UoSAT
FTL0 - File upload/download - G0/K8KA/UoSAT
PBP - File broadcaster - G0/K8KA/UoSAT

[Story via OSCAR-11]

* OSCAR-13 NEWS *
==========
Command Stations performed magnetorquing procedures near perigee of orbits on
October 15-17. The new transponder schedule is as follows:

Mode-B : MA 000 to 095
Mode-JL: MA 095 to 125
Mode-LS: MA 125 to 130
Mode-S : MA 130 to 135
Mode-BS: MA 135 to 140
Mode-B : MA 140 to 256
Omnis : MA 220 to 040

This schedule is expected to continue throu 26-Dec-90. The spacecraft
attitude is BLON = 180 and BLAT = 0.

* TNX QSL! *
==========
A special thanks to all those who sent QSLs, cards and letters to SpaceNews:
